TRAVANCORE.

PART I.

REPORT.

BY

N SUBRAMHANYA AIYAR, M.A., DEWAN PESHICAR,
CENSUS COMMISSIONER

TRIVANDRUM

PRINTED AT THE 'ANANDA PRESS'

1912

PREFACE.

This Report, which is the fifth of its kind, consists of four Volumes

- (1) The Report on the results of the Census.
- (2) The "Imperial Tables"—so called from their forming part of the Imperial series—which give the statistics for the five Administrative, and the two Natural, Divisions.
[The Report with the Imperial Tables form Parts I and II of Volume XXIII of the All-India series]
- (3). The "Provincial Tables", which embody figures for the smaller administrative areas
- (4) The Administrative Volume, which details the methods and machinery employed in taking the Census and in tabulating and compiling the results

Besides these four Volumes, a subsidiary booklet has been prepared, containing statistics of houses, population, etc, for the revenue and residential villages. In 1901, these particulars were printed as an annexure to the Provincial Volume. Now, in view to easier utilization by the several Departments concerned, it has been considered desirable to print them separately. The headings of information have also been recast and added to. The compilation and publication of figures for the Administrative Divisions constitute one of the new features of this Census.

2 Like that of 1901, the Report consists of twelve Chapters. There is the usual Introduction, which contains, in addition to an outline of the Census operations, a brief geographic and historic notice, intended to give the general reader an idea of the country whose Census it treats of. For the adequate appreciation of the distribution and movement of population, an account of the Administrative and Natural Divisions from the physical, economic and other points of view has also been inserted (*Vide* Chapters I and II). As Mr Gait has observed, "a Census Report is, in the main, a work of reference, and completeness is more important than brevity." This has been borne in mind, especially in the analysis of the statistics and in the exposition of the conclusions deducible therefrom.

In the Chapters on Religion and Caste, descriptive details are usually incorporated in abundance, and have, no doubt, their uses. But in spite of the most diligent accumulation of such materials, much substantial progress has not been achieved in the work of understanding the basic principles. The explanations advanced by Oriental scholars do not appear to have passed the stage of hypotheses, and in several cases, they are contradictory. In the belief that a contribution towards an enquiry into the deeper problems underlying may not be out of place, an attempt has been made in that direction as well.

3 In this connection, I wish to place on record my hearty appreciation of the services rendered to the Census by the Revenue Department under the various Tahsildars during the preliminary stages of enumeration and tabulation. My obligations are also due to the Division Peishkars and the Superintendent, Devikulam Division, who supervised and guided the Census operations in their

respective Districts, to the Conservator of Forests who directed the Census of the Forest reserves and the hill-tracts under his jurisdiction, and to the other officers and private gentlemen for their very cordial assistance. I am also indebted to the Superintendent of the Government Press for the arrangements made for the timely supply of Census schedules, slips etc., and to the Anchal Superintendent for their prompt despatch and safe delivery. The maps prefixed to the Report were printed under the direction of the Superintendent of Revenue Survey to whom my thanks are due for the neatness of execution.

The Report is printed at the "Ananda Press" Trivandrum and the care with which the work has been done deserves every praise.

4 The last and not the least sincere acknowledgment is fitly due to my Office. Except for a brief period at the outset Mr R. Ramalinga Aiyar n. a., who acted as my assistant at the Census of 1901 was in responsible charge. The testimony I then recorded to his "calm insight into details, untiring industry and loyal devotion" has been fully confirmed. Mr Ramalinga Aiyar is an officer of considerable steadiness of character and possesses capacity and intelligence of a high order. I beg to commend his services for substantial recognition by Government. Mr S. Sankaranarayana Aiyar of the Educational service was appointed as the Head Assistant in the Tabulation Office. His clear grasp of the several details which one familiar with a large statistical office can alone realize and his capacity for continuous hard work have been of great value. He is also recommended to Government for special encouragement. Temporary clerks—Messrs. K. Govindan Nair n. a., R. Sankaranathan Aiyar and S. Nilakanta Aiyar—have also by their good work willingly done established a valid claim for consideration.

5. A Census depends for its success on a number of working conditions, of which finance and responsible guidance are among the most prominent. I indulge in no extravagance of language when I say that in these respects, His Highness the Maha Raja's Government has placed me under the most abundant obligation.

REPORT

ON THE

CENSUS OF TRAVANCORE, 1911.

INTRODUCTION

I DESCRIPTIVE AND HISTORICAL

An account of Travancore with which it is proposed to introduce this Report may well be commenced with a brief reference to the larger territory of Kērala, of which it forms a conspicuous member. With a romantic origin and a chequered history, with features diversified to a degree and with a population remarkable in its domestic organization and social polity, Kērala presents a chapter of surpassing interest in the story of the Indian continent. The majestic Western Ghāts, with its 'magnificent array *in echelon*' of mountain heights, flank Kērala on the east. The Arabian Sea, whose waves raise their silvery spray on a hospitable shore, lines it on the west. In the south, it touches the Indian Ocean at Cape Comorin, the headland of the Peninsula. Thus rock-bound and sea-girt, Kērala appears a world in itself. If diversity in nature brings enchantment to the view, nature here is picturesquely diversified: if nature's grandeur strikes the imagination and holds the observer in wondering thralldom, here nature is frequently grand—the countless buttresses of wooded spurs, the ranges of laterite hills, the vast expanses of ever-green forests, the confused jungles and the terraced slopes, the widening valleys and the broad table-lands, the rapid rivers and the thousand streams washing down a fertilising soil, the paddy flats embosomed by cocoanut groves, the winding reaches of gardens throwing a canopy of perpetual verdure over the habitations beneath, the extremely varied flora and fauna, the endless chain of backwaters radiant from beneath an encircling fringe of feathery palms, the beautiful coast line with its long stretches of sparkling sands, the mysterious mud-banks with their cones of mud and water bubbling up from below, the generally abundant rainfall, the uniform temperature and the comparatively healthy climate. Above all, as if to keep guard over the favoured creation, Nature has reared the mighty Sahyādrī, whose serried ramparts force back the surcharged clouds in their career, to pour down their blessings on the earth below, and from whose lofty citadel she seems to enjoy the panorama thus unfolded—a panorama that embraces the entire Kērala in one comprehensive view.

Nor is the teeming population that occupies the land less interesting and noteworthy. First come the Hindus, and foremost among them stand the Nampūtiri and the Nāyari—the makers of Kēralean history and the moulders of Kēralean

civilization. In all India, they stand by themselves. The characteristic observances, the absence of sectarianism the prescription of celibacy in the case of Nampūtiri males to all but the eldest son, the system among the Nāyars of inheritance through females, the almost universal prevalence of the post-nubile marriage of girls, the avoidance of coloured clothing and simplicity in food, dress and decoration, the quasi-military amusements, the unflinching hospitality the gentility the general reserve—these are a few of the features which still distinguish them from their congeners. Equally important with these communities are the Izhava or the Tīya, the Pulaya or the Cheruman. They have been and are the salt of the earth. The habitual industriousness of the former is a remarkable feature and under the spirit of a new awakening they are developing activities of a varied kind. Diverse forces are working to elevate the latter whose condition, however caused, is one of small honour and low wages. From very early times, the population has been interspersed with other Hindu communities whose varied characteristics, social and personal have continued with more or less marked local colouring. Side by side with the Hindus are the Christians, the Muhammadans and the Jews, and all together present a remarkable commingling of races and religions. Each traces back its history to the most distant possible period. Everything appears so ancient in Kērala. The Jew wandered hither as early as the first century if not earlier the Christian received the Gospel from the hands of one of the Apostles of Christ trade attracted the Arab even before his Prophet bade him go and spread his religion. Under the shade of an uninterrupted toleration, rarely paralleled in the history of the world, the several religions and communities have lived and developed these long centuries.

To turn to the origin of Kērala, orthodox belief has it that the land was uplifted from beneath the blue waters by the Vishnu Avatār Sri Parashu Rama, and granted to the Brahmans and other castes led in by him. Probably in the most remote periods of geological time there was a deep convulsion of nature—an earthquake or a volcanic action—and the earth heaved from her primeval bed and rose as it were a gift from the ocean, for man to inhabit and replenish. Whatever may be the verdict which future ages may feel called upon to pronounce it would be conceded that, beneath the tradition, lies a substratum of historical truth. The theory is that the Aryans overflowing the central table-lands of India and pressing against the Ghāts in their advance towards the south saw this western sea-board spread before them. They entered and settled, and Kērala then blossomed forth to Indian view. But information is not available in regard to the events that marked the early history of the colony. One outstanding feature is noticeable however and that is, for centuries ancient Kērala appears to have had no political quiet. Now an oligarchy then a protectorship, now an elective monarchy and then a rehearsal perhaps, from the very beginning Kērala appears to have been oscillating from one form of government to another with periodic uneasiness—a result that is generally traceable to the policy of changing systems, leaving working conditions alone. But it is not easy to pursue these turns of fortune and mark the vistas before and behind. Suffice it to note that, in the course of time new powers arose from within and invasions from without became frequent. The disruption of Kērala began. The Chōlas the Chēras and the Pāndyas, the Pallavas the Chālukya and the Rāshtrakūtas thronged the stage the Kōlattiris and Zamorins swelled the scene. With the last of the Perumals, the curtain dropped on the political arena of Kērala. Travancora and Cochla emerged as independent kingdoms, leaving the rest of Kērala a hive of principalities to take arms against a sea of troubles and tossed about from Power to

Power, to finally pass a consolidated unit, safe and secure, under the direct sway of British Paramountcy

2 It is hardly necessary to remark that Travancore is one of the premier Hindu States in India. A Royal dynasty traced to the highest antiquity has continued on the throne in unbroken succession and the country has never experienced the grip of foreign conquest even in the zenith of Muhammadan ascendancy. A geographical isolation, as complete as, if not more than, that of India as a whole, has contrived to maintain inviolate the independence of the State, to develop to the full the ethnic insularity of the people and to preserve undiminished the institutional peculiarities of the country. It is matter for regret that materials are not available to trace, from its early stages, the continuance of this unique position. But it may safely be said that the political disquietude which characterized the ancient history of Kērala seems to have been repeated in Travancore, though in a smaller compass, for a long time after its separation about the middle of the ninth century. For nine hundred years more, the history of Travancore was the history of an intermittent struggle with neighbouring potentates. The Chōlas in the eleventh, the Pāndyas in the thirteenth, the Kings of Vijayanagara and of Madura in the sixteenth and seventeenth centuries made attempts to engulf it and efface its individuality. The attempts, though successful for a time, proved futile in the end and the eighteenth century saw the State marching on its own war-path. This century was epochal in the history of Travancore for, with it, modern Travancore begins. The epoch was inaugurated by His Highness Mārtānda Varma with the warrior-statesman, Rama Ayyan Dalawa, and followed up by his successor His Highness Rama Varma, assisted by the 'great' Diwan Kesava Pillai (afterwards Rai Kesava Dās). The former made Travancore as it now exists and ushered in an era of order and peace, the latter consolidated the State and cemented it in everlasting friendship and alliance with the British power. "Mārtānda Varma was one of those whom the world produces but at rare intervals. He was born to command and to conquer. He had the best of schooling—that of hardship. He had the best of teachers—foes. He was served by one of the ablest of ministers. Sully did not serve Henry IV of France more ably and faithfully than Ramaiyya did Mārtānda Varma."

Ascending the Musnud in the year 1723, Maha Raja Mārtānda Varma first quelled the insurrections and rebellions within the country, and "ended the long tale of crime and bloodshed committed by the lawless band of Ettuvittil Pillamais and Madampimais who molested the land for a period of two centuries and more." He then started on his career of conquest. The Rām of Attungal quietly resigned her sovereign authority. The taluks of Nedumangal, Kottarakara, Pattanapuram and Shencottah were taken over from the Kottarakara and Pantalom Rajas and annexed. The Rajas of Qulon and Kayankulam were also brought under subjection and then principalities added. The absorption of the territories of the chiefs of Ambalapuzha, Thekkumkoor and Vadakkumkoor followed soon, and in this career of territorial aggrandisement, the *coup de grace* was given by the final overthrow of the fugitive chiefs at the battle of Porakad. The putting down of further petty insurrections, the repulsion of an attack made by the Zamorin of Calicut and the extension of Travancore towards the east of the Ghāts summed up the rest of the military history of the reign. The flush of crowded victories and the overload of the spoils of war served, when peace returned, to turn a characteristically Hindu

* His Highness the late Maha Raja of Travancore (*Vishakhom Thirunal*)—1891

Sovereign to the tutelary Deity of the Royal house. The country was not on firm ground, the State coffers were exhausted, internal disturbances had not quite ceased, and there was the added fear of complications with the trading nations of Europe. In such a critical juncture, His Highness deliberately resolved to merge the State in the Church. On the 17th of January 1750 accompanied by the members of the Royal family his minister and the principal officers, he proceeded in state to the shrine of Sri Padmanābha Svāmī at the Capital and publicly dedicated Travancore to the Deity by what is called the *Thiruppadadanom* ceremony (gift at the sacred foot steps) undertaking to administer what then became Padmanābha's State as His agent and trustee with the official title of "Sri Padmanābha Dāsa" (Servant of Sri Padmanābha). This dedication, prompted by the then necessity meant that all revenue was to be collected in the name of Sri Padmanābha Svāmī (*Pandārācalai Mūthal*) and expended for the protection and development of the country's national life. There were various other remarkable achievements which redound to the lasting credit of the Maha Raja and his minister the most notable being the organization of a commercial department and the provision of a basis of rules, procedure and accounts for the conduct of the administration.

The reign of His Highness Mārtānda Varma, which closed with his demise in 1758 was succeeded by that of His Highness Rama Varma who ruled the country for a comparatively long period of forty years. Parur and Alangad were absorbed during his reign which, though never so trying and laborious as the preceding was disturbed by the aggression on the confines of the State by Haidar Ali and his son. But the intervention first of the Dutch, and then of the English who had been permitted to settle in the country about a century previous and had erected a factory at Anjengo near Trivandrum and with whom the Maha Raja had already entered into an agreement, secured Travancore from their clutches. In 1795 a formal treaty was concluded with the English which guaranteed protection against all invaders from sea or land. The improvement of the old and the erection of new fortifications, the construction of the historic frontier lines in North Travancore stretching from the foot of the Ghāts to the Cochin backwater opposite Crāngasūr the opening and improvement of communications, the development of commerce by the formation of merchant settlements and the building of trading ships, the creation of new ports the consolidation and promulgation of rules and laws—these were among the most notable acts and measures that characterized the reign, carried out despite falling financial resources and the uneasiness and anxiety generated by the fear of external wars and internal disturbances. Towards the lasting success of the reign, the greatest contribution was made by Rai Hetava Dīs, the first Diwan of Travancore who was as victorious in peace as Rama Ayyan was in war and the crowning achievement of the period was the firm establishment of political relationship with the English East India Company.

His Highness Bala Rama Varma succeeded to the throne in 1798. In view to the better protection of the State the Treaty of Perpetual Alliance and Friendship already entered into with the British Power was revised in the year 1800. The reign was however marred by the mal administration of the then minister the mutiny of the troops, the insurrection of Velu Tampi Dalawa and last but not least by the depletion of the treasury. On the demise of the king in 1810 Her Highness Gouri Lakshmi Bai assumed the reins of Government and Colonel Munro the Resident the office of Diwan. The short period during which Colonel Munro administered the country was brimful of activity. Internal order was

restored and the State was relieved of its heavy financial burdens. The most momentous of his measures was the assumption of the ownership and management of the Hindu temples (Devaswoms) with all their properties in the year 1812. This measure, to quote the words of Mr Shungoonny Menon, the historian of Travancore, was "the means of causing a permanent additional revenue to the State, for, after meeting the expenses of the various Devaswoms, it left a good margin in favour of the Sircar." Each Devaswom had, in addition to its religious influence over the people, a large territorial area over which it exercised, through its lay-trustees, proprietary and even sovereign rights, and the amalgamation, with the already formed Church-State, of these minor Devaswom tracts or *nads*, seemed a natural step. In fact the unification, referred to above, of Church and State initiated by His Highness Mārtānda Varma, while it suggested and facilitated the assumption of Hindu temples by Colonel Munro, gave it a welcome in the minds of the people, as being a re-affirmation and continuation of that policy. Another notable measure of the period was the adoption, by Colonel Munro, in 1813, of the monopoly system in regard to salt, in view to bring its manufacture and sale into line with the system introduced into the Madras Presidency between the years 1805—1807.

Her Highness Lakshmi Bai died in 1815, leaving two minor sons and a daughter. Her sister, Her Highness Gouri Pārvati Bai, became Regent. She continued unabated the policy of her predecessor and the regency was marked, among others, by the liberal support given to Christian missionary enterprise. In 1829, Prince Rama Varma attained majority and was crowned king. Several reforms in the cause of well-ordered government signalled his reign. Among these may be mentioned the issue of a Code of Regulations for the constitution of Civil and Criminal Courts and for the administration of justice, the commencement and completion of a survey of garden lands, the impetus given to trade, the ordering of the Census of the population and the establishment of the first Government English School at the Capital. To these public achievements, the Maha Raja added his personal contribution in the realms of literature and the fine arts. His literary and musical compositions in devotional religion have earned for him an undying reputation, while his patronage of learning in its varied branches made Travancore the happy resort of many an individual of culture and accomplishment in India. Many details of his religious and social life have been adopted as indispensable court-customs by his successors, and, as is the practice at Buckingham Palace in London where His Majesty's Piper plays the bagpipe under the windows of the Royal apartments during the King's breakfast, the devotional music as composed by this talented Sovereign is still played in an adjoining room, while the reigning Maha Raja is at his breakfast and his dinner.

The Maha Raja was succeeded in 1847 by His Highness Mārtānda Varma. He was a great patron of the Malabar theatre, a skilled doctor of European medicine and a most affectionate *pater familias*, having had the melancholy privilege of tending and nursing two orphan grand-nephews, the last of whom now adorns the Travancore musnud. He signalled his reign by the prohibition, by law, of serfdom in the land. There was not, in early times, "the slavery of the industrial professions" on which, in the words of Dunoyer, "the economic regime of every society which has recently become sedentary is founded." But the spirit of exploitation setting in created two classes, land-owning capitalists on the one side and cultivating labourers on the other. As long as, with the difference of status, there was the recognition of identity of interest, the situation was bearable. But when one got divorced from the other, service degenerated into serfdom and slavery successively,

and the demoralizing effect on both sides was the worst that could be conceived. As in the West so in the East, "there were admirable exceptions—both among masters and amongst slaves—instances of benevolent protection on the one side, or of unselfish devotion on the other which did honour to human nature but the evil effects without doubt preponderated." Hence the philanthropic measure of Maha Raja Mārtāṇḍa Varma.

With the close of Mārtāṇḍa Varma's reign commences later modern history. Two brilliant Maha Rajas filled the throne during the quarter century beginning from 1800 to 1835. The striking public measures of the period need alone be referred to. Of these the first was the withdrawal of the control by Government over the disposal of lands held by ryots on what was called the *pandāravaka* *pāṭṭam* tenure or Sircar lease and making them freely alienable which formerly they were not. Permanent occupancy all along existed, the difference being that when such lands were required for public purposes improvements only and not the ground value would be compensated. When, however the ryots felt the need for encumbering and alienating the lands either from the pressure of want or the push of enterprise the restriction, though calculated to conserve lands as far as possible in the hands of the old agricultural families, became inconvenient in effect and had to be removed. Another step of note was the Interportal Convention of 1800. Every producing and trading country having a separate Government has its own system of raising public revenue and protecting its land and labour which form the sources of that revenue, by means of duties and imposts. Travancore had also such a system of indirect taxation and industrial protection. In view of the friendly political alliance with the British Government it was agreed under the Convention which the adjoining State of Cochin, with its interlacing boundaries, also joined that as far as articles of commerce passing through British India and Cochin State were concerned, no duty need be levied by Travancore and vice versa in regard to goods passing to British India and Cochin through Travancore. As the partner who would have the largest interest in the Convention, British India was to fix the tariff value and rates of import duties, so as to best protect the interests of all parties concerned. Subject to a few minor restrictions, exports and monopolies were left unaffected. Thus was established a sort of tripartite commercial federation the British Government undertaking the responsibility for safe pilotage. The revenue aspect of the system was not omitted to be taken note of. The loss of revenue to Travancore accruing from this arrangement was undertaken to be compensated by the British Government by an annual payment of Rs. 40,000.

These two measures belong to the reign of the astute Maha Raja who deceased in 1800. The short reign of his distinguished successor was marked, among others, by the inauguration of a new Revenue Survey and Settlement, a step which surpasses any administrative measure ever undertaken since the consolidation of the State into its present form." The abolition of the system of securing supplies and services by means of remuneration in land, the former by payment of value in addition known as the *Viruthi* system belongs partly to this and partly to the succeeding reign. This system, whose benefit ran in hereditary title under favourable assessment secured permanent agricultural holdings for a large number of indigenous families and ensured certain supplies and services needed for the State without disturbance to the financial equilibrium. But the diminution of agricultural profits due among other causes, to the pressure of population on land, the general rise in the value of articles and the increased cost of living made the situation difficult. Unless the

assignment of lands were largely increased and the prices of supplies which had been fixed long ago, largely augmented, it was inevitable that the supplies and services would be neither easy nor efficient. Till the satisfactory level of adjustment was reached, therefore, fraud on the one side and oppression on the other must be the natural result, and in the unadjusted condition, the system in which the dominant partner was the Government assumed the appearance and manifested the evils of forced labour. Although some attempts were made to raise the level of remuneration, it could not go far enough and the system which, in its nature, is unsuitable to the times, was done away with. The assigned lands were permanently registered in the names of the holders and assessed to revenue like other lands. The complete abolition of the *Vinuthi* system, the final closure of the Survey and the Settlement operations and the replacement of the system of tax payment, part-money and part-kind—the latter liable to money conversion at the market price on notice of demand—by a system of all-money in the first instance calculated at a commutation rate favourable to the ryots, all these belong to the succeeding reign.

His Highness (*Mūlam Tirunāl*), the present Maha Raja, succeeded to his ancient heritage on the 19th August, 1885, at the early age of twenty-eight. It is now 26 years, and with every year, the anxious solicitude of a dutiful Sovereign has been increasingly manifest in the various departments of activity. Education both for boys and girls has made vast strides. Primary education has been made free. Besides a Teachers' College with equipment for manual training, a College of Oriental learning has been established at the Capital and a special staff appointed for the collection and publication of Sanskrit manuscripts. The Public Library has been remodelled and developed on a most liberal scale and a scheme of lectures instituted to popularise scientific knowledge. In view of the fragmentary nature of Travancore history, an Archæological department has been started. Agriculture which is the mainstay of the people has received special attention not merely through the great irrigational undertaking known as the Kodayār system but in a number of other ways. The Planting industries engaged in the raising of special products have greatly developed, and a separate department has been established for the responsible guidance and supervision of agricultural operations generally. A survey of the mineralogical possibilities of the State has also been arranged for. Medical relief has steadily expanded, a full-timed agency for the safe-guarding of public health has been organized and the system of indigenous Indian medicine has been given full official recognition and support by the constitution of a regular department to sustain and direct its activity. To the steady policy of improving communications on which the State has abundant reason to pride itself, the Railway has been added and bids far to include Travancore in its world-wide circuit. Under the administration of a line of able *Diwāns*, public revenues have risen from 66 lakhs in 1061 M. E. (1885—'86) to 121 lakhs in 1085 (1909—'10) and the expenditure from 64 lakhs to 119 lakhs—the achievement in the domain of finance having been especially remarkable within the last quinquennium. To crown all, the longings generated by the civilization of the age have been generously responded to. From the organization of many a Municipality—the seed-plots of local self-government—to the establishment of the Legislative Council and the Popular Assembly, institutions with infinite possibilities for good to the rulers as well as to the ruled, the start and the progress have been easy and natural. To conclude in the words of Lord Ampthill, a former Governor of Madras —“Here in Travancore, the people are pious, law abiding, industrious and loyal. The country is rich in undeveloped resources. A rising generation of young men is growing in intelligence and enterprise under the fostering care of the

State and the Ruler of the land, who is revered with all the devotion which is accorded to an ancient and renowned Royal lineage, is striving diligently for progress and reform.

II THE CENSUS

3 Different circumstances appear to have contributed to the institution of the Census in different countries and the objects which it encompassed necessarily varied to a great extent. In Rome where the term is said to have had its origin, it was mainly directed to fiscal objects. On the Continent of Europe "the tendency to central organization for purposes of administration and police prepared the way for statistical enquiries into the numbers of the inhabitants of particular areas." In the United States of America, the necessity of providing a basis for representative government seems to have originated the Census. Till the opening of the nineteenth century the population of Great Britain could only be guessed at like the populousness of China at the present day. In India, a Census was inaugurated in the reign of Chandragupta by his minister Chanakya, and its scope covered the entire administration of a country's interests. But whatever its origin and its initial objects, a periodical record of the people and their condition—domestic, social and economic—is the only sure basis of protective rule. Such a record may be generally taken to relate to the growth of population, the progress in the quality quantity and number of agricultural products, manufactures and raw materials from the surface as well as from the entrails of the earth, the advance of knowledge the development of the physical intellectual and moral nature of the people, the expansion of commerce and the enhancement of the facilities of transport and communication. In view of these elements of general well-being it has been the accepted duty of every Government that recognises its position as an integral part of the nation, liable to be affected by the slightest happenings to it, to keep up an accurate account of them all. With such statistics properly interpreted development or deterioration can be conclusively judged and precisely measured in each of the manifold functionings that constitute and determine a people's life.

4 The institution of the Census in Travancore may be traced to the early years of the last century. It may be carried to even earlier periods if attempts at estimating the strength of particular sections of the population are brought under the general term. In their Memoir of the survey of Travancore, Lieutenants Ward and Conner quote Bartolomeo who speaks of the counting of the Christian population in 1787. They also mention that the 12 years used to estimate their number by the amount they could muster for warlike purposes, one in each family being always at the command of the chief whose force was in fact thus formed. However the attempt at ascertaining the strength of the entire population was first made in the years 1810—1820 in connection with the survey of the country referred to. The population was then estimated at 906,857. The next counting which followed after an interval of twenty years, gave 1,290,608 as the total number. Fifteen years later in 1851 a third attempt was made but this time the population was found to have decreased to 1,262,617. The figures returned at these Censuses were only very rough computations and disclosed violent variations in the movement of the population unwarranted by the conditions that prevailed in the country during the inter-censal periods. They were therefore considered unreliable. A regular enumeration on well-devised methods was undertaken for the first time in the

year 1875 This was succeeded by another in 1881 which was taken synchronously with that of British India Since then, the Census has been a decennial institution

5 The Census of 1911 with which this Report deals was the fifth systematic enumeration and was taken, under command of His Highness the Maha Raja, on the morning of the 11th March In British India, the final enumeration was made on the night of the 10th March, but here, in view of the configuration of the country and of the scattered houses most of which are within enclosures, a night Census of the resident population has been all along considered unsuitable The final revision, therefore, was conducted by daylight on the succeeding morning and purported to record the facts as they stood on the previous night The month and date were proposed by the Government of India and accepted by His Highness' Government as suitable to Travancore The considerations which weigh in the selection generally refer to the age of the moon for securing enough light for the night enumerators to complete their records, the absence of fairs, religious anniversaries and important festivals, and of auspicious dates for marriages and for baths in sacred rivers, &c, which draw away large numbers of people from their homes

6 (1) As compared with the previous Census, that of 1911 showed a substantial advance, in methods and machinery, calculated to bring the system into close correspondence with that of British India They will be found described in the Volume on the Administration of the Census There were also other features in the form of Special Censuses to which reference is made in para 10 *infra*,
Changes introduced

(2) As the piecemeal system of taking up the arrangements on the approach of each stage and of issuing rules and instructions from time to time was found inconvenient, a Census Code embodying the entire instructions from start to finish was drawn up on the lines of the India Census Code, and issued in two parts, one dealing with Enumeration, and the other with Tabulation and Compilation.

7. (1) *The Village Register*—Census work was started with the preparation of a register of residential villages (karas as they are called) in each taluk Though these karas have not been surveyed and delimited, they are sufficiently well known and recognised It, however, happens that the growth of a kara results in the absorption of its neighbours into itself or in its throwing out fresh villages locally known by distinct names It is also not uncommon that altogether fresh villages come into existence and existing villages disappear At each Census, therefore, the register of villages has to be revised with reference to inter-censal changes and brought up to date.
Preliminary procedure.

(2) *House List*—When the village register was ready, a list of houses was made out for each village and a number assigned to each house Buildings not ordinarily occupied as residences were also included in this list The listing of houses was closed on the 16th October, 1910, when the numbering was taken up, and this was completed by the 15th December, in the last taluk.

(3) *Preliminary Enumeration*—This consisted in the entry, in the schedules, of the required particulars regarding the persons resident in each house To ensure an accurate record, the Census officers were carefully trained in their duties Classes were held in which the instructions for filling up the columns were explained The Enumerators and Supervisors were further required to prepare test

schedules which were examined by the Charge Superintendents, and the mistakes corrected and explained. The test schedules were then forwarded to the Census Commissioner's Office where they were again scrutinized and further errors, if any detected and communicated to the Charge Superintendents, in view to see that they did not occur in the actual enumeration. The Enumerators, thus trained, took the preliminary enumeration with the aid of the house list. The entries were generally made first on plain paper and, after examination and approval by the Supervisor copied on to the printed schedules. While the Enumerators were thus engaged, the Supervisors and the Charge Superintendents constantly tested their work. The testing was not confined to these officers. The Polahkars (Chief Revenue Officers) of Divisions who supervised the entire operations in their Districts, checked the enumeration as often as possible. I toured through the country during the preliminary stages and personally tested the work in all the taluka. The preparation of the preliminary record which was commenced on the 30th December 1910 was over by the 18th February 1911. The period remaining before the 10th March was utilised by the Tahsildars in making arrangements for the final Census, while special Supervisors, one for each taluk, deputed from the taluk office establishments, examined the schedule books, as they were being received after the preliminary enumeration. This examination by a special staff was an item in procedure new to the last Census. It resulted in the further elimination of errors in the schedule entries.

8. (1) For the final Census, the services of all officers and servants of Government drawing a salary of Rs. 100 and below were made available. As this number was insufficient, the help of private individuals was also largely requisitioned. All the public offices, schools and cutcherles were closed for three days to enable the men to get trained in their Census duties and to duly carry them out. Excluding the men engaged under special arrangements, the final Census staff consisted of 20,042 Enumerators and 2,293 Supervisors. An Enumerator had, on an average to visit 30 houses and a Supervisor was responsible for the work of 9 Enumerators.

(2) On the morning of the 11th March, the Enumerator went round his Block and brought the preliminary record up to date by striking out the entries for persons no longer present and entering the necessary particulars for fresh arrivals. In regard to the Census of the floating population of boats in the landing ghāts, and the inmates of jails, &c., the enumeration was made on the previous night under special arrangements.

(3) After the Census was over the Enumerators in each Circle met their Supervisor at a convenient place previously appointed and, under his guidance prepared abstracts of occupied houses and of males and females, in their respective Blocks. The Supervisor checked the abstracts and compiled them into a summary for his Circle and forwarded the same to the Charge Superintendent who, on receipt of all the Circle summaries in his area, compiled the totals for his Charge and telegraphed the result to the Census Commissioner Trivandrum.

9 The Charge totals were then combined into totals for the entire State and the result was reported to Government and telegraphed to the Census Commissioner for India. The arrangements made for getting the Circle summaries and preparing the totals for the several Charges were so thorough that the State totals were ready on the 12th March the second day after the Census. On the first day the totals were received from seventeen talukas, and from the remaining by the evening of the second. The taluk that came

in first was Kunnatnad, the last taluk being Ettumamur. In view of the nature of the country and the difficulties of communication, the extreme celerity with which the final result was made available is remarkable. It is also noteworthy that the provisional total of the entire population differed from the figure subsequently arrived at after compilation, by only 1,279 or 03 per cent—a difference extremely small in a population of about $3\frac{1}{2}$ millions.

10 In addition to the particulars usually recorded at the Census, certain additional information was collected by means of special enquiries. This formed a distinguishing feature of the 1911 Census.

Special Censuses

- (1) *The Industrial Census*—The occupational statistics furnished by the general Census indicate merely the functional distribution of the people, distinguishing workers from dependents and showing also occupations combined with agriculture and occupation by caste. They do not give detailed and reliable information regarding industries and their development. To remedy this defect, an Industrial Census was ordered in British India, independent of the general Census, and a special schedule was prescribed to be filled in by the owners or managers of factories, mills, mines, &c., in which at least twenty persons were employed on the Census date. A similar Census for Travancore was sanctioned by His Highness' Government to be taken on special schedules, and a separate agency composed of Government officials was engaged under the responsible supervision of the District Magistrates. The schedules were distributed a few days before the 10th March and filled up on that date by the owners and managers, with reference to the persons then actually employed.
- (2) *Census of certain Departments*—In view to complete the information as regards the extent to which modern industrial developments have influenced the functional distribution of the population, it is considered necessary to know the number of persons employed on the Census date in certain Departments and undertakings of non-productive labour, such as, the Railway, the Post Office, the Telegraph and Irrigation Departments. The Government of India prescribed certain forms for the purpose and instructed the authorities concerned, to compile, in communication with the Census Commissioner, the returns for the first three Departments, and to forward the same to him soon after the final Census. For the Irrigation Department, the State Chief Engineer collected the required information. As, independent of the British Post, the State has all along had its own Department for the purpose, figures were collected for all Postal employes, Travancore as well as British.
- (3) *Census of Home Industries*—Here, as in several parts of India, the bulk of the industries are still pursued by the people in their homes. It was, therefore, proposed to collect, in separate forms, statistics for home industries as a necessary complement to the Census of factory industries. The work was entrusted to the village staff who attended to it along with the preliminary enumeration.
- (4) *Census of Cattle*—As agriculture is the support of the population, statistics which throw light on the conditions essential to its pro-

perity cannot fail to be of value and interest. A Census of live-stock was, therefore taken in a separate form prescribed for the purpose. It was carried out by the village staff during the preparation of the house lists and was over when the house-numbering was completed.

11 Although a movement like that of the suffragettes in England who, as part of their political campaign, offered passive resistance to the recent Census, is still a remote contingency in Travancore, gentle ripples of a different kind have not been altogether wanting. In the town of Nagercoil in south Travancore, the Muhammadans of a particular locality quietly declined to give any Census particulars to the Enumerators, unless the house-tax that had been recently introduced was abolished. Moral suasion coupled with an alternative threat of prosecution smoothed matters and the schedules were duly written up. Barring this small incident, the attitude of the people was one of helpfulness to the Census agency.

12. The slip system of working out the results of the enumeration, which was introduced at the Census of 1901 was continued at the last Census. Under this system the entries in the schedules are copied on to slips of paper one slip being used for every individual enumerated. To reduce the labour of copying slips different colours are prescribed for the different religions, and the shapes of the slips are varied or symbols printed on them, to indicate sex and civil condition. In view to facilitate copying abbreviations and signs are allowed in regard to the entries most generally met with. The copied slips are then compared with the schedules and errors, if any corrected by a separate set of clerks. When the checking is finished, the slips are bundled by blocks, and guide-slips placed on each to show the total number of slips in the bundle with particulars of the village taluk, &c. to which it belongs. These bundles are then transferred to the sorting office where they are taken up in turn and sorted into pigeon holes, first by colour for religion and then, by symbol for sex. Each heap is then counted and the total checked with the entry on the guide-slip and also with the population statement already prepared and sent in by the Tahsildar. When the bundles for all the blocks in a village are thus sorted, the figures are totalled and entered in a register. When a taluk is over the bundles so checked are made into boxes according to sex and religion and issued to the sorters. This distinction of religion and sex is preserved throughout the entire sorting operations. On receipt of a box, the sorter sorts the slips therein, in turn for the different Tables prescribed. When the sorting for a Table is finished, each sorted heap is counted and the total entered in a form called the sorter's ticket. While sorting is going on the officers in charge check the sorting by examining the slips and counting the numbers in the different heaps. The officers spend almost their whole time in this check which is applied at every stage and for every table. When the check is over the figures are verified and the tickets passed. The figures entered in these tickets are then posted into the compilation registers and totals struck and verified by the application of certain secondary tests. The last stage consists in compiling from these registers, the Provincial and Imperial Tables. The Tables are finally passed after being subjected to certain indirect tests of probabilities, absolute and relative. The entries in the slips are all made in the Malayalam language.

13. The copying of the slips was arranged to be done at each taluk head quarters. In regard to Devikulam in the High Ranges the Tahsildar reported that sufficient hands were not forthcoming.

The work of this taluk, therefore, was arranged to be done in the Census Commissioner's Office

The taluk posting offices were organized as soon as possible after the final Census. In three taluks, the work was commenced on the 14th March, 1911, and by the 27th, the work was started in the rest. The entire posting and checking closed in all the offices by the 2nd June, 1911. The first taluk to send on the written-up slips was Tovala, and the last was Erianiel.

14 The sorting of slips and the entry of the results in sorters' tickets was done in Tiruvandium in a separate office opened for the purpose. It was commenced as soon as the slips of a whole taluk came in, the office being gradually enlarged with the expansion of work. 15 sections were formed, each under a Supervisor with a clerk to assist him. Inspectors were appointed and the several sections were distributed among them. An officer styled 'Head Assistant' was placed in immediate charge of the office. This work continued from the 15th May, 1911 to the 31st July. The detailed procedure which regulated the sorting and the tabulation will be explained in the Administrative Volume. It may be noted, however, that the most general Tables were taken up first, so that, after sorting for them was over, the arrangement of the slips facilitated the passage to more particular ones. In all, the slips were sorted for 15 Tables, of which 13 had been prescribed for the India Series.

15 In the posting offices, the number of hands in the copying and comparing sections varied from month to month. The maximum strength reached was 357 posters and 121 checkers. The number of slips copied averaged 325 per day of 6 working hours, and the number compared, 922. Each sorter sorted on an average 3,894 slips per day, the number varying with the nature of the Table—from 2,582 slips for Occupation (Table XVA) to 8,837 for Birth-place (Table XI).

16 The cost of tabulation and compilation comes to Sixai Rupees 15,691—chs 12—c 6, or in British Indian currency, Rs 15,416—As 2—Ps 5. The rate per thousand of the population works out to Rs 4—As 7—Ps 11. When compared with the 1901 Census, the present expenditure is in excess by As 10—Ps 11. This is due, in the first place, to the higher rates of pay that had to be allowed, consistently with the general raising of salaries and wages of labour within the last decade. It is also due to the decentralization of the operations and the creation of 31 taluk head-quarters with a supervising agency for each in the place of the 6 sections that worked in the Central office in 1901. In this arrangement, the greater expedition with which the work was completed was the compensating circumstance.

17 The entire expenditure on the Census operations up to the 1st August, 1912 has amounted to Sixai Rupees 68,830—chs 12—c 5, or in British Indian currency, Rs 67,622—As 14—Ps 3. A sum of Sixai Rupees 8,000 has been budgetted for to meet the further charges. The total thus amounts to Sixai Rupees 76,830—chs 12—c 5. This includes the cost of translating the Report into Malayalam, the language of the country, and does not take credit for the anticipated sale-proceeds of furniture, and very probably, the additional amount may not be fully expended. Calculated, however, on this amount per thousand of the population, the rate of cost works out to Rs 22—As 0—Ps 2. But, to institute a fair comparison with the 1901 figure,

items which are special to this Census must be kept out of the calculation. Unlike in 1901 my pay and allowance, as well as the cost of certain special appliances purchased by the Survey Department for executing maps and diagrams in photo-print, have now been debited to Census expenditure. If these items are separated, the expenditure would go down to Rs. 49,882-As. 10-Ps. 6 or Rs. 14-As. 8-Ps. 7 per one thousand of the population. This is Rs. 3-As. 13-Ps. 1 less than the corresponding rate in 1901. The village Revenue staff was no doubt utilized for work which formerly was paid for but an allowance was given to the employes, and this lessened what would otherwise have been a greater saving in expenditure.

CHAPTER I.

DISTRIBUTION OF POPULATION

(TABLES I, III, IV AND V)

General.

From the historical retrospect given in the Introduction, a general idea will have been gathered of the circumstances which led to the expansion and consolidation of the territories of Travancore, and of the chief administrative measures that have been carried out, from time to time, in furtherance of the people's well-being. In this and the next Chapter will be discussed the distribution of the population over the surface of the country and its development, especially during the last decade. As a preliminary to an appreciation of the statistics dealt with, the physical characteristics of the country, its soil, climate, productions and capabilities, which have a close bearing on the population in its statical and dynamical aspects, will now be briefly touched upon.

Physical and other features

Almost triangular in shape, with geographical bounds indelibly marked on two sides, Travancore occupies the extreme south-western portion of the Peninsula and covers more than two degrees of North Latitude, from 8° 4' to 10° 21'.

It forms a fairly compact block of territory, except in the north-west, where the intertwining boundaries of the Cochin State break the continuity of its outline and impart to it the appearance of a tessellated pavement. The spread of the country is from south to north. With a total length of 174 miles, it covers, at the widest extremities, a breadth of 75 miles. The maritime boundary is almost straight and is 168 miles long. On the east, where the limits run over a length of 220 miles, the contour is rendered irregular by the confines of the mountainous bulwark that separates the State from the Madras Presidency. The irregularity of this outline raises the periphery of the country to as much as 560 miles—an extent out of proportion to its total area.

The State encloses two small tracts under the British Administration, namely, Anjengo, in the Chinayinkil taluk of the Trivandrum Division, with an area of 251 acres and a population of 3,779, and Tangasseri, in the Quilon taluk of the Quilon Division, with an area of 99.59 acres and a population of 1,793 souls. They go to form the Anjengo District, and the British Resident in Travancore is its Collector and Chief Magistrate.

In regard to physical features, Travancore seems to concentrate and emphasize those of Kērala in general. The littoral area with its backwaters, the inland plains, the meandering valleys widening gradually towards the hills, the waving slopes, the rivers and streams which bathe the hill-sides and flood the plains, the exuberance of the vegetation all over, the mountainous amphitheatre in the background, the wide range of rainfall and other

climatic variations—these are the characteristics that typify the features and determine the capabilities of the country. They will be examined below a little in detail.

Hills rivers and lakes.—The hill and river systems claim the first attention. The tract known as the High Range continues the Western Ghāts and, at Anaimudi, rises to an elevation of 8,837 feet above the sea-level—a summit higher than any south of the Himalayas. The Oṛdamom Hills come lower down with wide plateaus and hills running up to 5,000 feet while further south, the mountains diminish to 4,000 feet in altitude. The Ghāts do not here form a continuous chain but consist of a series of ridges. From the base of the Ghāts, a succession of hills of every size and shape runs westward and southward, and breaking up the evenness of the land about on the lakes and, in the south approach closely to the sea. The total extent covered by the mountains, hills and forests is estimated at 2,500 square miles.

From this tangle of hills and mountains rise several rivers which, with their many affluents and distributaries, flow tortuously along varying distances, often between overhanging hills and high, precipitous banks. Though of unequal depths, the rivers are navigable for many miles during a great part of the year and are immensely useful for purposes of communication and for the transport of timber which it would be otherwise difficult to bring down from its forest home. The volume of water carried down during the rains is so huge that on leaving the elevated parts, the rivers overflow and inundate considerable areas of the adjoining tracts. This feature mostly confined to North and Central Travancore influences the agricultural industries a great deal. In the south however where the rivers are few and the rainfall deficient, the waters that flow have to be husbanded to the fullest extent and directed into channels for irrigation. Of the fourteen principal rivers running over an aggregate length of about 700 miles, the most remarkable from the scenic as well as the economic standpoints, are the Periyār (143 miles) the Pamba (60) the Tāmraparni (37) and the Kodayār (20). The water of the Periyār river has been under an arrangement with the Travancore Government, diverted by means of a colossal dam and is now effusing fertility over the British Indian District of Madura. A similar dam on the Kodayār river in Travancore has recently been completed by the Sircar and is calculated to relieve scarcity and expand cultivation in four at least of the southern taluks of the State the total area to be thus helped being estimated at from 50,000 to 60,000 acres.

There are about a dozen lagoons along the coast, covering an area of 167 square miles. Connected together by canals, they provide an easy water-communication from Trivandrum northwards, uninterrupted throughout the length, except at the Varkkallai promontory where however two insignificant tunnels join them one on either side. A narrow strip of land, varying from half a mile to seven miles in width separates these backwaters from the sea, and the bar intervening has to be cut open in places when the lakes are in high flood. The land adjoining the lakes in the northern parts are flat and generally sandy while toward the south they consist of low cliffs and table lands.

Trees and vegetation.—The variations in altitude, the heavy rainfall and the climate account for the dense forests and rank vegetation peculiar

to the country Teak * heads the list of valuable timbers of which there are about two dozen kinds—ebony, blackwood, *tembāvu*, *anjali*, *thambagom*, *venga*, *vaga*, *manimaruthal*, white cedar, red cedar, *vūl*, *marla*, *venteah*, *cheeni*, *ilavu*, *senchandanam*, &c Most of the valuable timbers are exported. On the plains, in the valleys and on the lower sides of hills, the cocoanut and areka palms, the jack, the mango, the bamboo, &c, abound almost everywhere, while South Travancore appears to have a special monopoly of the palmyra palm. The minor species that grow on the hills are of every description, and of the fibrous plants and medicinal herbs, it is estimated that there are more than one thousand. The herbs are so largely utilised in the Indian methods of treating diseases that they have in no small measure contributed to making the Malayālam country the most favourable home of Āyurvedic science and practice, and lend justification to the cry for their systematic examination and furtherance on modern lines. There is a whole mountain in South Travancore called *Marutvamalai* clothed, it is believed, with herbs of such medicinal properties that the very breeze wafts health to those that breathe it † At all events, a scientific exploration of the medicinal wealth of the country seems not without promise. It may also be noted that exotics appear to thrive well on the soil of Travancore, such as camphor, rubber, manilla plantain, mahogany, &c. The forests of the country are reserved by the Government, the total extent of the reserves being estimated at 2,325 square miles.

Soil, climate and rainfall—The soil, though irregular and varied, may be classed under a few broad heads—sandy along the coast and the backwaters, clayey in the valleys, gravelly in the lower slopes of hills and lateritish or stony in the upper regions. The sand rests on a layer of clay and vegetable matter and being saturated with sea-salt is admirably suited for the cocoanut palm. The clay of the valleys is brownish in some places and black in others and is frequently admixed with sand and vegetable earth. The soil of the slopes is red and gravelly and comparatively infertile, the laterite substratum breaking out in these parts into boulders of sizes. The higher lands are mostly stony and present different degrees of barrenness. On the whole, the soil cannot be considered rich and does not fully compensate the labour expended by the unambitious ryot. The fertility of the deltaic areas is, of course, due to alluvial depositions.

The climate along the littoral tracts, though damp and sultry, is regular, that of the higher lands ranges from fever-heat to pinching cold, while in moderate elevations it is equable. The hot season commences from the middle of March and continues till the burst of the south-west monsoon early in June. About the middle of October, the north-east monsoon begins, but its effect is only partial on this coast. With December, the wet or rainy period closes, giving way to the cold season. The mean temperature of the atmosphere is 78° and ranges on the plains from 70° to 90°. It goes up by 5° or 6° on either side at the base of the hills, while higher up in the mountains, it falls

* *Tectona grandis*, *Diospyros Ebenum*, *Dalbergia latifolia*, *Terminalia tomentosa*, *Artocarpus hirsuta*, *Hopea parviflora*, *Pterocarpus marsupium*, *Albizia procera*, *Lagerstroemia flor-reginæ*, *Dysoxylum malabaricum*, *cedrela toona*, *Xylia dolabriformis*, *Vitex altissima*, *Lagerstroemia lanceolata*, *Tetrameles nudiflora*, *Bombax malabaricum*, *Gluta Travancorica*

† This appears in palpable conformity with the tradition identifying it as a bit of the Oshadhi Parvatham dropped from the hands of Hanuman during its carriage to Lanka for the resuscitation of Sri Rama's devoted brother

to 50° or 60° in the day and to the freezing point in winter nights, the variations depending on the altitude. The most prevalent diseases are malarial fevers, small-pox, cholera, elephantiasis and leprosy especially in the northern sea board taluks, skin diseases and diseases of defective nutrition generally. The rainfall varies in different parts of the country. The littoral belt has an average annual rainfall of 68 inches, the sub-montane area 93 inches, and the mountainous 110 inches. During the south-west monsoon, the number of rainy days ranges from 82 at Padmanabhapuram to 85 at Peermade and the total rainfall from 22 to 141 inches.

Productions and trade.—Rice is the staple product. The area under rice lands, as per the Settlement returns, amounts to 577,226 acres or 901.01 square miles. Next comes the produce of the cocoanut tree which, like the areka, is more at home on the Malabar Coast than anywhere else in India. Its products are so valuable and useful that they rank high in the scale of life's necessities and form the chief commodities in trade and commerce. The total number of trees enumerated at the Settlement is 11,637,931. The areka numbers 7,451,002, the jack 1,845,900, the palmyra 2,215,802, the mango 133,823 the *pinnas* 330,152 and the tamarind 64,180. Garden cultivation covers 1,367,051.25 acres or 2,186.03 square miles. The plantain grows in almost every garden and readily supplies the domestic requirements of the people. Tapioca, pepper and ginger are other principal productions. The hill-produce covers a large variety of which coffee, tea, rubber, cardamom, dammer, honey wax, saffron, gums, aromatic grasses such as lemon &c., are the most important. Of the total estimated area of 7,593.10 square miles, 6,218.03 square miles have been actually surveyed. Of this, 4,714.45 square miles represent the area brought under Settlement operations and consist of 1,063.09 square miles of cultivable waste lands, 503.43 square miles of lands unculturable or unavailable for cultivation and 3,031.03 square miles, or 65 per cent. of wet or dry cultivation.

The annual total value of the external trade of the country averaged 34½ lakhs during the last decade—the exports amounting to 20½ lakhs. Much over one-half of the exports comes from the yield of the cocoanut palm the other articles being tea, pepper, arecanuts, dry ginger, jaggery and molasses, saltfish &c. Of the imports, rice and paddy, cotton twist, piece-goods and tobacco form the chief items.

2. For purposes of administration, the State is divided into five Divisions and 33 taluks. In the year 1909 the fifth Division Devikulam, was newly constituted out of the adjoining taluks of the Kottayam Division and the Cardamom Hills. As noted in para 4 of the 1901 Report the latter was not even then a distinct Revenue unit though regarded all along as a separate District for magisterial planting and census purposes.

On previous occasion taluks have been reckoned as the chief unit and it has not been the practice to give statistics for Divisions or consider them in any detail. In the year 1901 however a departure was made in favour of what was termed Natural Divisions, formed on climatic considerations and Tables were prepared for them and embodied in the Imperial series. It is now proposed to exhibit the statistics for the Revenue Divisions as follows.

For an adequate appreciation of the statistics generally, an acquaintance with the physical and other features of these larger units of administration is a desirable preliminary. A brief resumé of these features is therefore sub-joined.

Padmanabhapuram Division.—This Division represents old Travancore and is full of early political associations so reverently cherished by all Travancore Sovereigns. It contains the ancient capitals, Sri Vāzhumkod or, in common parlance, Thiruvāmkod, in the Eraniel taluk—for the still further corruption of which into the word Travancore, the State is indebted to the Portuguese—and Padmanabhapuram, the present head-quarters of the Division with its historic palaces and forts. Embracing an area of 613 square miles, this Division occupies the extreme south. The tail of the Ghāts which here slopes into undulating table-lands and soon sinks to the level of the plains, confines it on the east and, after affording at Aramboly a frontier outlet to Travancore, loses itself in the southern waters within a short distance of the main headland. The mean rainfall of the Division is 36·4 inches and varies from a normal of 28·2 inches at Vilavankod to 50·5 at Kalkulam. The average fall is lower here than in the other Divisions, as also the mean number of rainy days during the monsoon periods. The climate is agreeably dry, especially towards the south which is frequented as a health resort. On an eminently culturable soil, a double wet crop is usually raised and dry cultivation is largely availed of. 44·6 per cent of the entire area is covered by forests, hills, &c., of the remaining 339·4 square miles, as much as 98·2 per cent is under cultivation. With the larger of the two rivers running uselessly along deep beds, the Division had been long suffering from frequent scarcity inseparable from a precarious and inadequately stored rainfall. Irrigation under a large reservoir has recently stepped in to relieve the distress and is helping to transform the entire area, given the other conditions of labour, manure, &c., into the first granary of Travancore. As if in formal recognition of the principle that, without industrial and other channels of food-distribution within a country, mere food production must be aimless as the general policy of a people's protection, Nagercoil, the heart and centre of the granary of Nānchanād, was helped from early times to be the seat of industry and trade. Direct Royal initiative and patronage originated the settlement in Travancore of some of the weaving castes, and many streets in the town of Kottai of old Roman fame (only recently recognised for all official purposes as Nagercoil) are named after the royalties of the State. Some of the chief weaving centres which supply the characteristic wear of the ordinary population are situated in this Division. The once abundant production of cotton in areas now being gradually placed within access of the irrigation system and converted into rice lands, led the way to the development of the spinning and weaving industries, and although the former has mostly died out, weaving continues to be the home industry of several families, pursued of course under great difficulties and handicaps. As the chief seat of the palmyra palm, the Division exports large quantities of locally manufactured jaggery. The fishing industry is also largely carried on. In the Eraniel taluk of this Division is Kolachel which is the portal of foreign trade for South Travancore.

In its general aspect, the portion known as Nānchanād, comprising the taluks of Tovala and Agastisvaram, resembles more the immediate east coast of Madras than true Malabār, except that, as already remarked, a well-

adapted system of irrigation gives to a fertile soil in a zone of uncertain rainfall, a richness that contrasts sharply with the arid plains yonder. The population is preponderatingly Tamil, and in its appearance and mode of living in its character and institutions, seems more an offshoot of the east thrown in by the frontier pass than a southward extension of Kērala.

Trivandrum Division—The head-quarter Division of the State Trivandrum intervenes between the northern and southern Divisions and partakes to some extent of the ethnic and physical characteristics of both. But with neither the abundant river system of the north nor the irrigation conveniences of the south, its possibilities of cultivation are entirely dependent on rainfall. The mean fall for the entire Division is 60·8 inches and ranges from 55·4 inches at Neyyattinkam to 66·9 at Nedumangad. But the falls are irregular and there are few tanks to store the monsoon showers. To compensate the disadvantage as it were springs which issue in several places from the acclivities of the hills keep the surrounding tract in a state of moisture and help very appreciably certain kinds of dry cultivation. The mountains, hills &c. take up about a fourth of the total extent of 843·15 square miles. Of the remaining area, one-half is covered by garden lands but wet cultivation stands limited to about one-eighth. The two together form 62·5 per cent. of the cultivable area and leave an ample field still for persevering industry. The soil is not barren and is as varied as that of South Travancore while the climate covers a wide range from the warm dampness of the coast to the bracing chilliness of the Ponnudi hills. In the Nedumangad taluk of this Division, the working of the plumbago mineral is being carried on. The Neyyattinkara taluk was also a seat of this industry but the mines have now been abandoned.

Quilon Division—The genuine Malayālam country may be said to begin with this Division if, for the moment the administrative appendage of Shencottah across the border is left out of consideration. It contains the most important ports of the country and the chief centres of industry, commerce and trade. The Tinnevely-Quilon Railway crossing the Ghāts at the celebrated Aryankavu Pass runs through this Division linking up the sea-port town of Quilon and displaying along its onward track the kaleidoscopic variety and the sombre magnificence of Travancore's mountain scenery. Breaking up the solitude and silence of the regions around, the Railway is stimulating their exploration and development. On either side of the terminus lies the watery arm of the backwaters connecting the Kottayam Division on the north and Trivandrum on the south. Along the eastern border are high ranges of mountains, several of which are over-run with extensive forests of teak and other valuable timber. Lofty hills, most of them equally well-wooded, with cultivated ridges and grassy plains, follow in succession, till the undulating surface glides into one vast champagne which gives to the Division its peculiar feature. The Division has a mean rain fall of 90·3 inches, and the normal, at recording stations, varies from 74·6 at harunagapalli to 101·9 inches at Ambalapuzha. During the monsoon period the floods carried by the net-work of rivers and streams that traverse the Division and the canals that branch off from them submerge the whole of Kuttanād by which name this plain tract is known, and convert it into one watery expanse. Notwithstanding this serious drawback agricultural operations which here consist mainly of draining and ridging are pursued with

restless energy and perseverance, and prove eminently fruitful. The alluvial deposits caused by the overflow give to the soil a fertility in direct proportion to the degree of inundation to which it has been subject. In the upper reaches of the rivers that empty themselves into this cloaca, the cocoanut and the sugar plantations overshadow the banks, and extend to the inside of valleys and to the slopes of hills, the cocoanut palm flourishing forest-like over the entire littoral area right up to the sea's edge. Out of a total extent of 2,564.31 miles, a little over two-fifths of this Division is covered by hill tracts and forests, &c. Wet and dry cultivation takes up 973.07 square miles or 70.8 per cent of the remainder.

Shencottah, which lies at the foot of the Ghāts on the eastern side, is reserved for separate notice, as its climate, productive activity and population, give it a striking dissimilarity to the country on the west. It seems to the visitor an outpost of Tamil Tinnevely, but is really the relic and record of the transghātian territorialism of the State. It is a fertile plain interrupted only by detached hills, and the coarse gravel and laterite of the west is seldom seen here. The permeable clay of the valleys imparts to the soil a fertility not easily exhausted. The taluk is intersected by several streams and rivulets and provided with numerous tanks and channels. Shencottah shares in both the monsoons, but the south-west which deluges the western side of the Ghāts drops here in gentle and refreshing showers and makes the climate during this period very agreeable and salubrious. The conditions are, however, quite different during the rest of the year which is at times extremely unhealthy. The normal rainfall in the taluk is 32.8 inches.

Kottayam Division —This Division which is the northernmost in the whole State is, along its western march, but a continuation of water-logged Quilon. The great Vempanād estuary takes up the water communication near Alleppey and leads it on to the extreme border, raising up several islands on the way and almost cutting off a full taluk (Shertallay) from the mainland. The rainfall ranges from a normal of 57.2 inches at Kunnatnad to 139.2 inches at Minachil. The mean fall for the entire Division is 102.2 inches. The sandy margin of the backwaters, fertilised by the breath of the sea and the debris of superjacent growths, forms a regular cocoanut plateau. In the interior, the aspect of the country is rugged, and the hills are covered with thick forests presenting the wildest scenery. In the mountainous tracts further east, the teak and the bamboo flourish in abundance. The hills, forests, &c., that are not available for cultivation cover 35.3 per cent out of a total extent of 2,318.75 square miles, and 85.8 per cent of the remainder is cultivated area. The northern boundary of the Kuttanād paddy flats extends over four taluks in this Division. In the absence of any irrigation system, cultivation generally is dependent on the periodical rains and on the rivers and rivulets that cross and re-cross. Here, areka, ginger and pepper thrive in luxuriance. Cheikkal or shifting cultivation is a noteworthy feature of this Division. The hill tracts covered with dense-grown jungle are cleared and burnt during the hot months, and with the first shower, paddy is sown. Between this and the reaping, there is happily no intermediate process and, after a bumper crop has been harvested, the land is allowed to lie in repose for from 6 to 12 years. The lower slopes of hills are largely utilised for the cultivation of dry grains. The recent introduction of rubber into Travancore has greatly changed the aspect of the lesser heights which afford a most suitable field for this promising industry.

Devikulam Division—To the east of the Kottayam Division lies Devikulam, north to south along the Ghāta. This Division, measuring 1,254.55 square miles or about one-sixth of the entire State is made up of Peermade and the High Ranges, and constitute the chief forest wealth of His Highness the Maha Raja's territories. Though it is now largely the home of the wandering hill tribes and the natural haunt of the elephant and the tiger evidences of an abundant population having once lived here as fair types of the civilization of the East, strike the observer on every side and call for expert research. This Division receives the heaviest downpour of the monsoon, with a fall of over 200 inches. Once the seat of the Cardamom monopoly it has for some time been the chief centre of the European planting industry in Travancore. Falls have been harnessed, communications increased and the latest appliances of production and transport have been set up. Labour pours in from several parts, though its chief recruiting field is British India. A wilderness and a waste for a long time in the medieval history of the State the Division exemplifies to-day what foresight and enterprise can achieve under organized guidance and support.

3. With such a disturbed homogeneity of physical peculiarities, as above outlined, the several Administrative Divisions do not help to conveniently bring out the broader aspects of Census statistics. For this purpose Natural Divisions based on geographical and climatic features have to be formed. Such a scheme was worked out at the 1901 Census and, in view of the tried suitability of the Divisions then adopted, viz., the Western and the Eastern, it is proposed to retain them at this Census. The areas comprised within each are enumerated on page 4 of the Imperial Tables and the general considerations which guided their constitution are indicated in the extract given below for ready reference.

In the absence of well-marked territorial differences in respect of language or race, Natural divisions have to be based mainly on the leading geographical and climatic features. Vast as these physical conditions are, they operate within such a small compass that they shut off into each other by imperceptible degrees even within the small territorial units into which the State is parcelled out for administrative purposes. Nevertheless certain broad distinctions are not wanting. Two divisions may thus be marked out, one, the littoral and deltaic and the other the mountainous and sub-montane. In regard to rainfall, climatic conditions, nature and capacity of the soil, amount of water-supply and facilities for communication and transport, the belt of land that stretches along the coast presents clear points of advantage over the regions in the interior. From the statistics such as have been furnished by the Meteorological Department, it is seen that the littoral area has a mean annual rainfall of 73.57 inches as compared with 97.00 inches in the mountainous and sub-montane tracts. But the steep declivities on which the rain falls cannot evidently benefit the area of its incidence as much as the area of its convergence and ultimate spread. In regard to climate again, the littoral tract is the more favoured of the two Natural Divisions. There is not along the coast that sudden variability of temperature from scorching heat to biting cold, which is seen to characterize the more inland tracts. As for diseases, malaria in its protean manifestations and its varying degrees of severity is a severe handicap to settlers of the interior regions. The gravelly soil of the inland tracts is poor beyond measure and contrasts in an appreciable manner with the alluvial deposits of the littoral belt. Circumstances such as these inherent in the physical conditions of Travancore give a distinctness to the two Natural Divisions.

Area, Population and Density

4 Imperial Table I gives the area and population of each Division, Administrative and Natural, and of the State as a whole. Similar information for taluks is contained in Provincial

Table I printed at the end of the Imperial series of Tables and in Table I

of the Provincial volume. The main statistics and the other items of information which go to elucidate them are embodied in three Subsidiary Tables appended to this chapter—Tables I A and I B giving density, water-supply and crops for the Divisions and taluks respectively, and Table II showing distribution of the population according to density. Three maps are annexed illustrating (1) the density of population

by Administrative Divisions, (2) the proportion of the culturable and cultivated areas to the total area in each Division and (3) the densities of taluks as comprised in each Natural Division. A diagram will also be found comparing the density of the State with those of other Indian Provinces and States.

5 According to the final result of the survey recently brought to a close, the total area of the State is, as already noted,

7,593 76 square miles. The excess over the figure adopted for the 1901 Census, amounting to 502 73 square miles, is due to more accurate measurements, to the inclusion of the areas of some hill-tracts surveyed during the past decade and to differences in the estimate of extent of unsurveyed hills. In addition to the reasons just mentioned, inter-district transfers of jurisdiction and, on a small scale, reclamations and extensions of cultivation have contributed to the differences in area observable in the component administrative units.

Divisions and taluks—The Eastern Natural Division is over thrice as large as the Western—5,766 10 against 1,827 66 square miles—and includes within it almost the entire mountainous and sub-montane area of the State.

Of the Administrative Divisions, Quilon is the biggest, being nearly twice the Cochin State. Next comes Kottayam, which is more than twice the size of the State of Pudukkōttai. The Devikulam Division, which stands midway between these two States, takes the third place. The average area of a Division is 1,518 square miles.

Owing to the large number of the taluks or tahsils of which the State is comprised, the average extent of a taluk works up to only 230 square miles. Nine of them, with Chengannur at the head of the list, stand above, and the remaining twenty-four, with Parur at the bottom, fall below, this average.

6. The population according to the Census of 1911 is 8,428,975. This is about three-fourths of the total population of the Madras or Bengal States put together a little less than one-half of that of all the Bombay States and higher by over one-half than the number censused in the States of the Central Provinces. Covering but one per cent. of the entire territories of all the indigenous States and Agencies in India, Travancore has returned about five per cent. of their aggregate population. On an examination of some of the larger States separately the high ratio of population to area in Travancore will be seen to be striking. Kashmir with nearly eleven times the area of Travancore, has a population less by about three hundred thousands, while Mysore, which is four times as large, does not return even twice the population. Baroda, again, for about the same extent, possesses less than two-thirds the number returned for Travancore.

Divisions and taluks.—The population of the Western Natural Division is 1,976,184 and that of the Eastern 1,452,821. For less than one-fourth of the entire area, the Western or littoral Division contains 68 per cent. of the aggregate population. This congestion is a natural feature of the sea board tracts. The average population of an Administrative Division is 685,705 which is about three-sevenths of the average for a Madras District. The Divisions of Quilon and Kottayam have each a population which is more than

DISTRICT	POPULATION
Chittoor District	1,206,741.
Quilon Division	1,976,184
5 Caves District	1,190,327
Kottayam Division	1,452,821.
Pudukottai District	900,431.
Amalapur Do.	952,952.
Karikal Do.	925,150
Orissah Do.	673,929
Travancore Division	8,428,975.
Madras District	818,900.
Palnathalapuram Do.	430,997
Nalgonda District	118,818.
Devikulam Division	67,067

that of the Cochin State by over a third and a little less than a fourth respectively. The next two Divisions—Trivandrum and Padmanabhapuram—are more populous than Pudukkottai (411,890) and leave far behind the British Province of Coorg with its 175,004 inhabitants. The marginal statement arranges the five Division of the State in the order in which they come among the Districts of the Madras Presidency. Chittoor which is the eighteenth in the Madras list and has about the same population as the first District in Travancore has been taken as the starting point for comparison. The statement

is instructive as showing the high places which most of the Travancore Divisions occupy in the scale of Madras Districts.

Among the taluks, Neyyattinkara stands first with a population of 178,703. Tiruvalla (173,768) Quilon (163,798) Shertallay (156,580) and Trivandrum (155,138) come next in order. Quilon which stood fifth at the 1901 Census now occupies the third place. Thirteen other taluks have returned each 100,000 inhabitants and above. Ten taluks have a population of between 50,000 and 100,000 and the remaining five taluks below 50,000—Peermade (45,104) Todupuzha (38,426) Shencottah (33,307) Totala (34,503) and Devikulam (23,459). The population of a taluk averages 103,008.

7 *General remarks.*—It may be observed at the outset that the problem of density is a complicated one a variety of factors contributing towards the pressure of population in particular areas. They are—configuration of surface rainfall, irrigation, quality of the soil climatic conditions, existence of forest reserves and other unculturable or inaccessible areas nature of occupations pursued, political and historical

accidents, prevalence of characteristic diseases, facilities of communication, reach of markets and centres of trade, &c. The proportion of children in a population is considered as another important factor in determining density. Where the constituent elements are thus so multiform, there is no need to interpose the caution that the influence of a dominating factor may too often be disturbed by other agencies, which have also to be taken note of in the evaluation of the final result to the correct degree. It is generally assumed, for instance, that rainfall regulates the extent of populational distribution in rural tracts. But this correlation is not absolute. A high density may exist with a poor rainfall, where irrigation facilities are ensured. *Per contra*, the heaviest rainfall may support a very scanty population, as in the uplands where the soil does not admit of easy and profitable cultivation. The unhealthiness of certain regions again may have its discouraging influence. The existence of large forest areas may reduce the proportion of land available for cultivation, besides operating as a physical check to the people's expansion. Industrial occupations constitute an appreciable factor in determining congestion in specified areas. And here, as in other cases, the advantages of cheap communication and ready accessibility to markets also supervene. The influence of historical causes may also be referred to as of some significance in Travancore, which once bristled with principalities and which, in its present dimensions, is comparatively modern. When the relation between births and deaths at any period is such that the ratio of children ten years old and under to one hundred persons above that age is barely sufficient to compensate for the loss by deaths, the density of population is affected thereby, due allowance being, of course, made for the presence of artificial disturbing causes. Finally 'when the population of a place reaches a certain size, it is further increased by the establishment of offices, temples, churches, schools, police stations, law courts, custom houses, post offices, railway stations, &c. Density of population cannot be explained simply by the relation which exists between human beings and the soil. The relations of man with man must also be taken into account.'

Provincial density—The population returned at the Census, when viewed in relation to the total area of the State, gives 452 persons to every square mile of surface. The pressure of population appears very great, when compared with that of other Provinces and States in India. The diagram which illustrates this comparison points out the high position occupied by Travancore, and shows that Cochin and Bengal alone have a greater density. The United Provinces of Agra and Oudh follow Travancore closely, while the densities in the remaining twelve Provinces and States range from 75 per cent. in Eastern Bengal and Assam to 9 per cent. in the State of Kashmir.

If the mountains, forests and lakes, which occupy a third of the entire extent, be excluded from the reckoning, the density would rise to an average of 686 persons. The marginal statement compares the density figures calculated in both ways for each of the enumerations since 1875. With reference to the actual territory available for the spread of the population, the pressure at each Census has really stood at a degree much higher than is apparently warranted by broad calculations based upon aggregate areas. This aspect, it must be noted, lends a special interest to the problem of density in Travancore which, in addition to being a small State, is greatly cut up by hills and largely covered by forests and lakes.

Census year	DENSITY OF AREA	
	with forests	without forests
1911	452	686
1901	389	590
1891	337	511
1881	316	490
1875	301	463

These are elements, it need hardly be said, that must operate to set back the population, and delimit and define its eventual distribution.

These circumstances notwithstanding, the density of the State as a whole carries with it but a comparative value. To gain an adequate idea of the press of population in different parts of the country their respective detailed figures must be taken note of and correlated with the conditions which bear on them and local variations recognised and explained in the light of such correlation. This investigation is best made on the principle of Natural Divisions but before doing so the District or Divisionwise densities may be glanced at.

Administrative Divisions.—The figures show that the gross density is not evenly apportioned among them. They reveal the interesting feature of a sliding scale from one end of the State to the other. The congestion of population, which is at the maximum in the southernmost Division, diminishes as the distribution is followed up to the northernmost. Deflected eastwards from thence it falls, quite too abruptly in the newly constituted Division of Devikulam. To give the actual figures, the Padmanabhapuram Division with 102 persons to a square mile is subject to the greatest pressure of population. The head-quarter Division of Trivandrum comes next with a density of 669 the figure going down to 603 when the population of the Capital of the State is left out. The adjoining District of Quilon and its northern neighbour Kottayam, are even less thickly populated the former returning an average of 481 persons which, in the latter rises by only a slight addition of ten souls on every square mile. To the north-east of Kottayam lies Devikulam which closes the list of Divisions. It is the most sparsely populated tract, every 50 persons therein being free to occupy as much as one square mile. This descending gradation in density appears strangely enough connected with a feature that should ordinarily influence towards an ascending order. The sphere of scanty rainfall is seen to be the region of the densest population, and the pressure appears to diminish from Division to Division *pro tanto* with the increasing fall of rain. This want of accord between density and rainfall is explained by the factor of irrigation in the Padmanabhapuram Division while hills and forests conspire with an unyielding soil to break the harmony in the High Range tract.

The order of the several Divisions in point of density is further

DIVISION	PERCENTAGE OF AREA			People crowded to cultivable.
	not cultivated,	cultivable,	gross irrigated.	
1 Padmanabhapuram.	84.4	15.6	21.8	102
2 Trivandrum	64.0	36.0	34.8	669
3 Quilon	84.0	16.0	1.8	481
4 Kottayam	84.5	15.5	1.0	491
5 Devikulam	72.1	27.9	1.8	50

referable to the characteristics described in para 2 supra. The particulars of cultivated and irrigated area which are reduced to proportions and given in the

margun are instructive as summarising and comparing statistically the conditions of individual Divisions in that respect.

Natural Divisions.—The Western Natural Division has a density of 1,061 persons per square mile and the Eastern Division 202 or less than a fourth. If the uninhabitable and unculturable tracts which take up about a half of the Eastern Division be deducted, its average rises to almost two-fold. A disparity would still remain between the two Divisions and must be attributed to the great unlikeness in their physical features. The Eastern Division is mountainous and sub-montane the Western is littoral and

deltaic The former receives the heaviest showers of the monsoons, the latter enjoys the greatest benefit from them. On the individual total areas, the uncultivable extent takes up 45·5 per cent in the one as against a percentage of 20·5 in the other, while the net extent cultivated stands in the proportion of 35·4 to every one hundred square miles in the first compared with 72·7 to a like one hundred in the second. As between the cultivable and cultivated tracts, the disproportion is even more remarkable—35·1 per cent in the Eastern against 8·6 in the Western Division. The nature and acreage of the crops are not without their bearing on population-density. On an analysis of the cultivations reared, rice is seen to take up 26·8 per cent and palms and other taxable trees another 4·5 per cent in the Eastern Division as compared with 32·7 and 12·5 per cent respectively in the Western. In regard to the irrigated area, the ratio on the gross cultivated extent is, in the deltaic regions of the west, about thrice that in the interior tracts. The effect of greater facilities of irrigation in the Western Division is evident from its double-cropped area being twice the proportional extent in the Eastern. To sum up, 'this glutting of the population in the former is due to the greater means of procuring subsistence. The innumerable little rivers that gush from the acclivities of the Ghāts intersect the country in various directions and, spreading themselves far and wide, give to agricultural operations in the midland and sea-board taluks an impetus of a kind unknown to the hilly regions in the interior. The soil of this tract is naturally soft and fertile from alluvial deposits and not hard and unsuited for cultivation as in the upland area. Again, the easy means of communication and transport along the Western littoral which the admirable system of roads south of Trivandrum and the interesting chain of backwaters and canals extending from it to the north afford, stand in striking contrast to the woods and forests that stretch themselves along the base of the Ghāts where, assisted by savage beasts and savage malaria, natural conditions seem to interpose at every step a barrier to easy occupation. With the exception of a small area in the taluks of Vilavankod and Neyyattinkara which extend from the sea to the hills, almost every portion of the Western Division is cultivable. Whatever industries the country has developed are mainly confined to the littoral and sub-littoral tracts. The several ports small or great, are being more and more utilized for purposes of trade and commerce. Centres of civilization are increasing and six* out of the nine towns in the State, including the capital, are in this division. Professionals and non-professionals find here a ready field for employment. It was on this Western sea-board that the capitals of the ancient principalities of Āttīngal, Desinganād and Champakasērī—all of them now absorbed in Travancore—once grew up. It is natural, therefore, that, in this region of high cultivation and old civilization, the population should be in a highly congested state' †

Taluks—As already suggested, the mean density whether of the State as a whole or of its broad Divisions, Administrative or Natural, is but the converging reflex of varied internal conditions. An examination of density statistics must, therefore, fail, if the differing features in smaller areas are not taken in and compared. The deeper does the analysis descend, the clearer will be the influences that build up the culminating average, and the smallest unit that offers itself for such treatment is the *pakuthi* or revenue village. But, as its recognition for administrative purposes is of very recent date and does not yet

* Now 7 out of the 11 towns are in the Western Natural Division. † Travancore Census Report, 1901.

obtain throughout the country its development has to be watched and recorded for a long period before it can furnish basis for profitable study. Further particulars of physical and other circumstances bearing on the growth of population within the limits of a *pakuthi* are neither fully at hand nor are they easily compiled. These drawbacks while, on the one hand, they impede the endeavour to start discussion from the *pakuthi* area, must, on the other hand, detract from the value of the conclusions that may be deduced from the general figures of area and population. The next higher unit for which statistics are more or less available is the *taluk*, the immediate division of a District which may be taken up for consideration. Subordinary Table I B gives for each *taluk* the pressure of its total population on its total area. As fourteen *taluks* contain the eleven towns taken up for the Census, separate density figures for their populations, excluding the urban areas, have also been made out and entered within brackets.

The *taluks* with the highest densities are Parur—1,494 Kartikapalli—1,503, Karunagapalli—1,544, and Trivandrum—1,595, while the least crowded ones are Pattanapuram—133, Peermade—73, Todupuzha—68, and Devikulam—38. These variations cover such a wide range that the *taluks* would fitly assort themselves into eight groups, as epitomised in the margin. If the urban

No. of persons per square mile.	No. of <i>taluks</i> in each group	
	including urban population.	excluding urban population.
Under 150	5	5
150—200	5	2
200—250	2	2
250—300	2	2
300—350	3	1
350—400	4	0
400—450	2	4
450 & over	2	0

population is excluded, the density must naturally diminish in the *taluk* concerned but in the case of eight *taluks*, the grouping referred to does not alter. Though in regard to the six remaining ones, the deduction of the urban figures pushes them a group or two lower the pressure in relation to the other *taluks* is still heavy. Thus, the urban *taluks* occupy the four highest groups from 400—750 onwards, whether the density is taken to refer to the total population or to the rural merely. In a country with industrial and other developments yet in a feeble condition, the urban element must play a small part in the making of the population pressure and should not be accorded any exaggerated value. The following remarks recorded in connection with a British Indian Province would fully explain this circumstance and apply with perhaps greater force to Travancore.

The distinction between rural and urban population must always be a somewhat arbitrary one especially in Provinces like the Punjab and the North West Frontier which contain no manufacturing centres and export little but agricultural produce. All the towns are more or less dependent for their existence on the agricultural communities around them. Indeed it may be said that the smaller towns are merely large villages with markets for the interchange of local products and, in the main, of local manufactures. It is difficult to realise the extent to which the rural population of these provinces depend on agriculture. The riches (if any) are mainly derived from foreign trade and are not seriously diminished by agricultural depression, whereas, in these Provinces, the land is practically the sole source of wealth, and their population whether classed as urban or rural is directly or indirectly dependent on the produce of the soil. It is, therefore somewhat misleading to set aside the urban and discuss the pressure of only the rural population on the land.

A consideration of the incidence of population may therefore well take in the whole *taluk* urban as well as rural. Of the several determinants

influences, the most important are those connected with the soil, water-supply and crops. In Subsidiary Table I A which embodies the necessary particulars for all the taluks in the State, figures are given showing the pressure of the total population on the culturable and cultivated areas. The marginal

27	Muvattupuzha	28	30
28	Nedumangad	29	18
Under 150			
29	Chengannur	21	18
30	Pattannapuram	31	21
31	Peermade	32	33
32	Tolepuzha	30	32
33	Devikulam	33	31

statement exhibits by taluks the gradation in respect of these three densities. From the order taken by the taluks may be gauged, to some extent, the relative bearing of forest tracts, culturable wastes, &c, due allowance being of course made for distinctive factors that may operate as between any two taluks. Chengannur, for instance, with as much as 84 per cent of forests, returns but a population of 137 to a square mile, while Muvattupuzha with half that percentage has more than twice its density. To take an instance of the influence of other elements, deltaic Tiruvalla having a percentage of forests five times that of Minachil supports 1,009 souls on a square mile as against 565 in the latter. The well-irrigated Tovala taluk with 69 per cent of forest and other wastes and with a meagre rainfall has a density of 300 persons, while Todupuzha with the same ratio of forests and with four times the rainfall can boast of only about a fifth of that density. The taluks of Kalkulam and Kunnatnad afford a parallel illustration. A comparison of the several taluks in respect of the densities on the total, cultivable and cultivated areas, shows

that a higher proportion of forest tracts and wastes, as between one taluk and another, appears to have the general effect of reducing the density. It has to be borne in mind, however, that in interpreting the depressing influence of such areas, the existence of wastes awaiting population and cultivation has to be discounted.

If the distribution of the taluks among the several groups is viewed with reference to the Natural Divisions in which they are respectively situated, it is found that all the fourteen taluks in the four lowest groups lie within the Eastern Natural Division and take up 90 per cent of its area and 72 per cent of its population. The Western Division monopolises all the twelve taluks in the two highest groups which cover 72 and 80 per cent respectively of its aggregate area and population. Of the remaining seven taluks in the intermediate groups, 600—750 and 750—900, one in the former and two in the latter are in the Western Division, so that every one of the fifteen taluks here supports a population of over 600 to the square mile, as against only four such in the other Natural Division.

As among the Administrative Divisions, Devikulam contains none but taluks of the very lowest group, the majority of the taluks in the Padmanabhapuram Division belong to the three middle groups from 300—450 to 600—750, and three out of the four taluks in the Trivandrum Division

go into the three highest groups from 750—1000 onwards. In the Quilon Division are to be seen the extremes of density. Six out of its eleven taluks fall within the two highest groups. Here is 27 per cent. of its total extent with 67 per cent. of the aggregate population. On the other hand the lowest group takes up 14 per cent. of the population scattered over one-half of its area. The Division that shows a comparatively even distribution of its inhabitants is Kottayam where the constituent taluks are spread over all the groups except the second.

Towns and Villages.

8. The statistics regarding towns will be found in Imperial Table IV which classifies towns in the order of population, and in Table V which arranges them by Divisions and distributes the population by religion. Imperial Table III groups towns and villages according to size. The figures contained in these Tables are reduced to proportions and given in the following Subsidiary Tables printed at the end of the chapter.

Subsidiary Table III—Showing distribution of the population between towns and villages.

Subsidiary Table IV—Giving the number per thousand of the total population and of each main religion who live in towns.

Subsidiary Table V—Classifying the towns under five population groups and noting the variations from previous Censuses.

In the Report on the 1901 Census, the treatment of towns in the first Chapter was confined to the general statistics of population, and the other features, such as variation in population, the proportion of the sexes, the composition of the several religions, were dealt with in the chapters to which they logically belonged. But as these features are not so distinctive of towns as to deserve separate notice under each Chapter it is proposed, as an arrangement of convenience to deal with them where towns are first taken up for consideration as discrete territorial units.

9. As at the preceding Census, a town has been defined to include—
Definition of town. (1) every municipality or local area declared to be a town by or under the Towns Conservancy and Improvement Regulation and
 (2) every other continuous collection of houses inhabited by not less than 5,000 persons, or any other local area, declared by the Government to be a town for Census purposes.

In settling the places to be classed as towns under the second head, the circumstances suggested for consideration are the character of the population, the nature and strength of the social bond, the relative density of the dwellings, the importance of the place as a centre of trade and its historic associations. Overgrown villages which have no urban characteristics are not to be treated as towns.

Here it may be parenthetically observed that no sharp difference appears to have existed between town and village under the old constitution

of population centres Each residential centre was a fairly complete social organism in space, with its ryots supplying the primary want of man and with the various industrial and professional classes ministering to the secondary wants whereby food gets distributed and re-distributed The town was generally an over-grown village except when, containing within it the civil and military head-quarters of a kingship, it was a co-ordinate entity making up with the village the larger organism of the State But under the conditions of modern industrialism, the social bond of inter-dependence usually associated with village life has naturally loosened and the status of village is confined generally to places where the parts are still in vital coherence one with the other

10 Under the definition as given above, the eleven places specified in the margin have been treated as towns, against nine in 1901, the two additions being Tiruvalla and Alwaye. Of the total number, seven have been brought under the operation of the Towns Conservancy and Improvement Regulation,

	TOWN	POPULATION
1	Nagercoil	29,883
2	Trivandrum	63,561
3	Quilon	18,839
4	Shencottah	10,309
5	Kayankulam	5,830
6	Tiruvalla	7,969
7	Alleppey	25,665
8	Changanachery	17,242
9	Kottayam	15,141
10	Alwaye	3,863
11	Parur	13,782

as compared with five at the preceding Census The Padmanabhapuram and Trivandrum Divisions have one town each—the first and the second respectively on the list, Quilon contains the next five and Kottayam the remaining four As elsewhere stated, there is no town in Devikulam, the Division of large estates, where every plantation is a population centre in itself

The average population of a town is 19,281 If the two towns newly added at this Census are excluded, the average is 22,250—1,824 or 8.9 per cent more than in 1901 The percentage would rise even higher, if the averages for the towns common to both the Censuses be calculated on the populations returned within identical areas

In the Western Natural Division which comprises seven towns, the mean urban population is over twice that in the Eastern—23,647 against 11,640

The averages in the several Administrative Divisions do not admit of any logical comparison as, in two of them, with one town each, the total population must stand for the Divisional mean

11 Out of the total population of the State, 212,090 have been enumerated in urban and 3,216,885 in rural areas Thus, out of every one thousand, 62 are found to live in towns and 938 in villages In the Western Natural Division, the proportion of the urban to the rural element is 84 to 916 in 1,000, as compared with 32 to 968 in the Eastern

Of the Administrative Divisions, Kottayam is the most rural, only 44 per mille of its inhabitants being found within urban limits The town ratio increases to 55 in the Quilon Division and to 69 in Padmanabhapuram. The concentration in the urban area is most noticeable in the Trivandrum Division, with Trivandrum as its only town, where, in a total of one thousand

of its population, as many as 114 reside in the Capital, the rest being distributed over the outlying tracts.

Proportion of urban to total population
Each diamond represents 10 per mille residing in towns.

The distribution among four groups of one thousand of the urban population in each Division shows that large towns predominate. This feature is clearly brought out in the Natural Divisions, with the difference that, in the littoral and deltaic area, nearly three-fourths or 72 per

cent. of its urban population live in towns of over 20 000 inhabitants while there are none such in the interior tracts, where the town residents are distributed in the second and fourth groups in the proportion of 917 and 83 respectively

12. A classification by main religions of the population living in towns shows that, without regard to Natural or Administrative Divisions, the Hindus predominate throughout, forming 67.5 per cent. of the total the Christians come next with 21.3 per cent. and then the Muhammadans—11.3 per cent. Since the last

Distribution of urban population by religion.

Division.	No. per mille of urban population.		
	Hindus	Muhammadans	Christians
Palamcottah	782	94	180
Trivandrum	804	72	119
Quilon	691	177	131
Kottayam	673	81	243
Western Malabar Division	700	180	140
Eastern Malabar Division	683	64	67

Census the Hindus appear to have lost ground, as also the Muhammadans while the Christians have covered the space yielded by the other two.

This will be seen from the marginal figures which, for purposes of comparison, take into account only the nine towns common to this and the preced-

ing Census. The differing tendency on the part of the several religionists

	Ratio in urban population of		
	Hindus	Muhammadans	Christians
1911	67.5	11.4	20.9
1901	69.5	12.1	18.0

to congregate in towns and its relations to the nature of the occupation urban or rural, in which the bulk of each class is respectively engaged,

may be illustrated by taking the total population in each main religion and distributing it between town and country. Thus viewed, the town appears to attract the trading Muhammadans most and the cultivating Christians least—the urban percentages on their respective populations being 106 and 60 agains 63 for the Hindus. Though in the Administrative Divisions, the urban Muhammadans have been seen to be in a minority relatively to the other religionists, among themselves they constitute a higher ratio in the urban population of the Palamcottah and Quilon Divisions than in the other two. In regard to the Christians and the Hindus, the former are most urban in Trivandrum and Quilon where unlike in Kottayam they do not form more or less, the chief persons and the latter in Palamcottah and Trivandrum where the lucrative professions of urban life have been able to draw away the Hindu from their old rural habitation.

13 The total urban population has risen from 183,835 in 1901 to 212,090 at this Census, or by 15·3 per cent, an increase which has followed closely the variation in the entire population of the State. The increase, however, has not affected the ratio of the urban to the total population at the two Censuses, *viz*, 6·2 per cent. In view of the fact that the number of places treated as towns at this Census differ from that in 1901 and that some of these have been altered in their boundaries during the last decade, the growth of the urban element cannot be correctly judged from a mere comparison of the recorded figures. When the nine towns common to the two Censuses are alone taken into account and compared with reference to identical limits, their population works out to 201,538, or 17,703 in excess of the 1901 figure and shows an increase amounting to 9·6 per cent.

In a discussion of the variations in individual towns, it has to be particularly remembered that, as remarked a-while ago, the frequent change of boundaries, which makes portions of a town urban at one Census and rural at the next, hampers a study of its populational capacity. Of the five most important municipalities from which has to be gauged the real urban growth, the limits of Nagercoil, Trivandrum, Quilon and Kottayam were altered during the period 1891—1901. The alteration was not perceptible in its effect in the case of the first, but influenced the returns in regard to the other towns very considerably. During the last decade again, two of these latter, *viz*, Quilon and Kottayam, underwent another change, while the area of Alleppey, the fifth in the list, also happened to be re-adjusted. With these alterations, it becomes extremely difficult to estimate correctly the extent to which particular causes have contributed to variations within the limits under consideration. Births and deaths have been registered throughout the last decade for the five towns named above, and the statistics, such as they are, cannot fail to indicate the course of variation due to natural causes. But even this rush-light is, to a greater or less extent, obscured when it fails to be adjusted to the alterations in limits. All that is possible, therefore, is simply to take in and apply the figures as they are recorded.

Subject to these reservations, the growth or decline, as the case may be, of the several towns in the past decennium will be examined.

Nagercoil—The population recorded for this town is 29,883, against 25,782 in 1901—an increase at this Census of 4,101 persons giving a percentage of 15·9. The taluk in which the town is situated has gone up by only 12·2 per cent, while the rural portion has increased by 10·7 per cent. The growth of the town has thus been rather rapid in the last decennium. The public health of the urban area during the decade that has closed does not, on the face of it, appear to have been encouraging. Cholera has been a regular visitor. In one year it lasted throughout, while, in another, it gave way to small-pox after three months. The disease, however, was generally mild and sporadic and has not pushed up the mortality so as to over-top the births. The recorded statistics show an excess of 1,808 births over deaths with a natural increase of 7 per cent on the population of 1901. The town is a trading and manufacturing centre and one of the head-quarters of missionary enterprise in the State, and it is the portions of the town where these lie that have contributed greatly to the increase. It may be added that the relation of the urban to the taluk variation that was found to exist at the 1901 Census has been preserved in

1911 Ten years ago, the town population showed, as between 1801 and 1901 an increase of 180·5 per cent., while the percentage for the taluk as a whole was only 7·2. But an examination of the figures made it plain that the extraordinary increase was only apparent and an adjustment yielded a ratio of 9·6 per cent. as the real variation in 1901. In view of the parallelism between the urban and taluk proportions at the two Censuses, it may not be wide of the mark to say that the development throughout has been steady and uniform.

Trivandrum—The Capital has advanced in population from 57,883 in 1901 to 68,561 or by 9·8 per cent., the actual excess being 5,679. This is less than the variation in the Trivandrum taluk as a whole which is 15·6 per cent. and in the rural portion which shows a percentage of 20. Unlike Nagarcoil, the general health of the town appears to have been satisfactory in seven years during the past decade but in the remaining three, cholera prevailed throughout, during one year and small pox during the other two years. In the decade taken as a whole the virulence of these epidemics appears to have tilted the balance on the wrong side between births and deaths. But the returns of the earlier years are regarded as less correct than those of the later ones. If the last seven years during which registration appears to have been better attended to are taken into consideration, it is seen from the information supplied by the Health Officer that the excess of births over deaths suffices to give an increase of 4·4 per cent. to the population returned at the 1901 Census. Nevertheless, this does not negative the fact that death has been very busy in the few years in which the epidemics continued not only so the Census figures indirectly confirm it. Though in 1911 the proportion of children under ten years of age to one hundred persons over that age was greater than in 1901—30·4 against 29—it has by no means been sufficient to re-coup the waste by deaths.

Viewed apart from the statistics of births and deaths the Census figures ought to furnish a basis for comparing the increase of population as between the last two decades with the growth that has taken place between the two decades previous to the last. But this is rendered impossible in the case of Trivandrum. The town boundaries were altered during the decade 1801—1901 and the population in 1901 for the 1801 limits had to be calculated from fresh data collected for the purpose. The returns for 1911 stands however confirmed by other evidence. In the Malabar year 1053 (1901—'06) an enumeration of the resident population and of houses was conducted under the responsibility of the Health Officer as preparatory to the levy of house tax and the inhabitants then numbered 64,200. It has to be remembered here that, during each of the three succeeding years, the number of deaths was far in excess of that of any previous year in the decennium and that the mortality in the last year was the highest in all the preceding ten years. If allowance is made for this disturbing factor and for immigration, the municipal figure may be taken to have fairly anticipated the Census return. In regard to houses, again there were 10,480 occupied and 1,162 unoccupied houses or a total of 11,642 according to the Census. The list prepared by the municipality contained 12,416 houses but it included all bazaars cart-stands, &c. which are excluded from the Census definition of house. Subject to deductions for these extraneous items, the municipal and the Census figures are seen to exhibit a remarkable talliance.

Quil—Within the limits as defined in 1901 there were 17,601

townsmen, and 18,839 within the 1911 boundaries, the apparent increase being 3,148 persons or a percentage of 20. The limits of 1901 being taken for both the Censuses, there is seen an addition of 15.2 per cent, the actual population in 1911 as per those limits being 18,082. The health of the town was not seriously disturbed except in two years. The register of births and deaths gives a net increase of 1,145, which works out an addition of 7 per cent to the population at the preceding Census. The decennial variation in the taluk as a whole has been 26.3 per cent on the side of increase. The Lion Horse is stirring up the taluk and the town as well. As this and other facilities provided by Government get correctly used in an increasing measure, the town, which is a distribution centre for and between North and South Travancore, is bound to advance in population and importance and be once more one of the foremost places of business on the coast of Malabar.

Alleppey—Here, as in Quilon, with altered measures, no useful purpose is served by comparing the actual figures of now and before. There was returned a population of 21,918 in 1901 and of 25,665, ten years later, the increase being nominal—3 per cent. Within identical limits, the addition is negligible—0.8 per cent. The Ambalapuzha taluk in which the major portion of the town lies does not show any large increase during the decade, it being only 6.6 per cent. The small development of the town, however, may be ascribed to the vicissitudes it has undergone in the matter of public health, one-half of the past decennium having been a great strain on the inhabitants, with a deficiency of births to deaths amounting to as much as 1,997. Again as, for some years, the pier had fallen into disrepair, the numerous vessels that touch this important port had to miss the advantage of a safe anchorage and the commercial activity of the town became relaxed. Thirdly, the location of a District Court at Kottayam to which a portion of the territorial jurisdiction of the old Court at Alleppey was transferred has not been without its effect on the populousness of this seaport town. But with a restored pier and its increasing mills and factories, the future of the town is not at all bereft of high hopes and great aspirations.

Kottayam—This town shows a decrease in population from 17,552 to 15,111 at this Census, the figures referring, however, to different boundaries. But even if the same limits are taken, the increase is small—3.58 or 2 per cent. This is remarkable, as the taluk has gone up by 20.7 per cent. While the public health of the town has been unsatisfactory for five years, it has been generally good for the remaining five, and there has been an increase of 1,629 births over deaths. The explanation, therefore, for the small urban variation has to be sought in other directions. In the adjustments of boundaries during the last two decades, the town was progressively narrowed, and it is not unlikely that the town is expanding outside its regulation-limits and hence unable to reveal that growth through the means of town statistics. Further, as the medium of communication with Peeimade, Periyar and also the High Ranges, the town appears to be the supply depot for the plantations in those localities which, judging from the migration returns, attract large numbers from the taluk and town. The head-quarters of the Division and taluk, with a District Court recently established and with educational facilities of a high order, the town is, nevertheless, bound to grow even within the limits assigned to it.

Kayankulam—After a long hiatus, this small town, once the seat

of a principality is emerging into notice. Even twenty years ago, its admission into the category of towns was refused on the ground that its then population of 4,787 was below the prescribed minimum of 5,000. In a decade however it succeeded in qualifying itself for elevation by adding 1,006 inhabitants to its strength and in 1901, it came to be classed as an urban area. But the advance since has been tardy. The population has gone up to only 5,890 not even full fifteen persons having been added to every one thousand counted at the beginning of the decennium. Kayankulam lies enclosed by the borders of three rich taluks with villages all round enjoying robust constitutions and if it is not to slip by and be lost among them its chances lie in the brisk and prompt fostering of its trade activities, such as they are. A decade, however is too short a period for gathering up and it remains to be seen what account it has to give when the enumerator goes to it the next time.

Changanacherry—Like Kayankulam, this town was also the sometime capital of an old State (Thekkumkūr) and sank into oblivion with its absorption into Travancore. Christian influence has, however long sustained it and has made it a centre of its own. For a town such as this, which is an important exchange centre in addition, for the produce of North and Central Travancore, recognition was long in coming. It was only at the Census of 1901 that it was numbered as a town with a population of 14,204. Since then 2,978 persons (20·8 per cent.) have been added. With the facilities it possesses in the matter of trade, there is reason to hope that the town will gradually develop to a still higher degree.

Parur—This too has its story of departed greatness to tell, a Raja having once held sway over it. But it was only in 1901 that the place was taken in as a town. It then contained 12,902 inhabitants. The number has now risen to 13,783 or by 6·3 per cent. while the population of the taluk has increased by as much as fourteen per hundred. It is the seat of a District and Sessions Court, and for long divided with Alleppey the Division of Kottayam, for purposes of district judicial administration. Enclosed within Cochin territory and surrounded by a rural population marching two and a half times as rapidly as its townfolk Parur has to stimulate itself if it would show a greater advance in population. The ancient Jew is there but he is comparatively small in strength and does not show any marked sign of his historic enterprise.

Skeneoltah—Though not included among the Municipalities this place took its rank as a town along with them, thirty years ago. Its development has since then been steady though slow. Between 1881 and 1891 it showed an increase of 10·7 per cent. in its population. But in 1901 the Railway under construction drew about its works large numbers from far and near and the urban growth was lowered to 3·6 per cent. The works having been completed and the Railway now passing through the town has more than regained its men. The total has risen from 9,039 at the preceding Census to 10,309 now the percentage of addition being as much as fourteen. As the frontier station on the eastern face of the Ghats and as the *cuttome chowkey* of the State the town is steadily rising in importance.

11 The eleven towns arrange themselves under the five population groups marginally noted. The highest group, which contains only the town of Trivandrum, takes up 30 per cent. of the total urban population, and

with the next grade, as much as 56·2 per cent, while the lowest group consisting of Alwaye furnishes only 1·8 per cent. The richest is the middle group, which covers nearly one-half of the total number of towns and 35·5 per cent of the entire population. At the 1901 Census, the proportion for the two classes of larger

towns together was 59·1 per cent, and for the medium sized ones 32·9 per cent. The higher ratio at this Census of the latter group may be taken to indicate that the peopling of the comparatively smaller towns has been a little more rapid than that of the bigger ones.

Since 1901, the population of towns in group 10,000—20,000 has gone up by 10·8 per cent and that in the next higher group by 8·1 per cent. The

variation has been the same, 9 per cent, in the groups on either side, i.e., in 5,000—10,000 and 50,000—100,000. It is not possible to trace the urban development during the previous decades, as the number and limits of towns had considerably differed and as the great variations in population would necessitate elaborate adjustments before any safe comparisons could be made.

15 The number of females to 1,000 males in each of the eleven towns of the State is given in the margin and, except in regard to the two towns enumerated for the first time in 1911, compared with the respective figures for the preceding Census. In five out of these nine towns, the proportion has increased ;

Towns.	No. of females to 1,000 males in	
	1,911	1,901
1 Kayankulam	1,109	970
2 Shencottah	1,102	1,115
3 Nagercoil	1,053	1,059
4 Trivandrum	963	930
5 Changanachery	951	991
6 Quilon	952	938
7 Parur	950	914
8 Kottayam	926	919
9 Alleppey	920	955
10 Tiruvalla	887	
11 Alwaye	840	

while in two others, the ratio, though less, still stands above 1,000. The general aspect of sex-ratios will be fully gone into in the chapter on Sex. Here it will suffice to remark that the Hindus have contributed more to the unequal proportion in the towns of Trivandrum, Quilon, Alleppey and Kottayam, and along with the Christians, in the towns of Parur and Tiruvalla, while the Christians are solely responsible for the deficiency in the town of Alwaye and share the responsibility with the Muhammadans in

Changanachery

The urban population taken as a whole gives 942 females per 1,000 males. The highest ratio of females (989) is found in towns with a population of 20,000—50,000 and the lowest (840) in towns with inhabitants under 5,000.

16 The marginal figures give the density of population and houses in regard to the six towns for which statistics of area are available. Five of the towns are the principal municipalities of the State and the statistics in regard to them throw whatever light there is on the question of over-crowding in urban areas. In the State as a whole, the

Density in towns

number of persons per town house taking only the areas common to the last two Censuses has risen from 5.4 to 5.5. The number of persons per acre has also increased since 1901. The densities may appear low but if the different parts of a town are considered the question wears another aspect. The density figure for Nagercoil for instance is misleading as the town covers a number of straggling villages with large spaces

Towns	No. of persons		
	per acre in	per house in	
	1911	1901	1911
Nagercoil	14	12	4.8
Trivandrum	10	9	6.0
Quilon		6	6.0
Idukottai	8	4	4.1
Alleppey	11	11	6.9
Kottayam	4	4	6.7

between. Paddy flats stretch themselves just in front of the fort gates in the Capital and such open spaces are also numerous in the other parts. In these cases, the densities within the urban area are of varying degrees which, while keeping down the mean average rise to high levels in the most crowded portions. To take Trivandrum again, a dense population is naturally crowded within the fort enclosing the Palaces and the chief Pagoda. With an area of 170 acres and 63 cents and a population of 9,501 it gives a density of 58 persons per acre or 37.120 per square mile. In interpreting these figures the narrowness of many of the lanes and streets and the nature of the houses which never run to more than two stories have also to be taken into account. In such circumstances the problem of over-crowding must find its solution in the increase of building accommodation and in the progress that may be achieved in the maintenance of public health. Much has, of course, been done and it may be said that in point of municipal efficiency Trivandrum takes a high place among the towns of the Madras Presidency. Many directions of useful and even new activities however still remain and are receiving consideration.

17. There are two kinds of villages in Travancore—the *kara* and the *pakuthi*. The former is the population village and a unit of ancient date whose boundaries, though not surveyed, are locally well known. The latter which is the present unit is an arbitrary area treated as a village for purposes of land revenue collection and its limits are laid down at the Survey. Notwithstanding its seeming definiteness, the *pakuthi* lacks the essence of a residential village as it is really an accidental agglomeration of adjacent *karas*.

The *kara* has, therefore been taken as in 1901 as the ultimate subdivision for the tabulation and treatment of Census statistics. But figures are recorded for the *pakuthi* as well in view of their administrative value and are exhibited in proportional form in subsidiary Table VII for easy reference. Till recently the province with an average area of 2,861 square miles and an average population of 1,000,000 was the Revenue village. At the Survey and Settlement the *pravaras* as a unit and the smaller *pakuthi* unit adopted.

18. As yet the register of villages prepared by the Tahsildars the total number of *karas* returned is 11,000 or 70 more than the number of *pakuthis*. This increase is made up of an addition of 81 villages in the Eastern Natural Division and a deficiency of 11 in the Western the actual figure at the Census being 1,241 and 2,093 respectively. Among the Administrative Divisions the number of villages has declined in Kottayam by 31 in Talasseri by 20 and in Quilon by 10. In the two remaining Divisions there has been since 1901 an increase in the

total tale—18 in the Trivandrum Division and 124 in Devikulam. These differences are due to inter-divisional transfers consequent on the re-adjustment of taluk jurisdictions, to the formation of a new Revenue Division, and to better classification in the case of a few taluks. In the interior, the variations are explained to some extent by the shifting nature of the hill-men's huts.

19 The average area of a village is 1.91 square miles, against 1.95 in 1901. As between the Natural Divisions, the villages are closely packed in the Western, while, in the Eastern, forests and hills intervene to give them a larger extent of space, though to little purpose to the villager. As compared with the last Census, these as well as the Administrative Divisions show hardly any variation. In Devikulam, however, the increase in the number of villages has reduced the mean area from 28.5 to 9.5 square miles.

The population per village averages 813, or 101 more than at the preceding Census. This mean is exceeded by 52 in the Western Natural Division, but is more than that of the Eastern Division by 53. The District figures run over a very wide range. The average is lowest in the Padmanabhapuram Division—357, it rises to 519 in Devikulam and to 910 in Quilon. In the Trivandrum and Kottayam Divisions, the inhabitants per village number 1,077 and 1,131 respectively.

20 Of the total rural population 1,123 in a thousand reside in villages containing inhabitants under 500, and 556 in those with a population of between 500 and 2,000. The next group, 2,000—5,000, takes in 282 persons, while those who live in villages of the highest grade with a population of 5,000 and over, represent the remaining 145. A comparison with the proportions at the preceding Census shows that the smaller ones have lost as heavily as the larger have gained. In 1901 there were, in the lowest group, 36 persons more than now. During the decade, these quitted that grade and passed to the one above it. Doubling the number there and taking several more, they moved on and strengthened the villages in the two highest groups by 59 and 23 respectively. Both the Natural Divisions share this feature in regard to the size of villages, but it is more marked in the Western Division than in the Eastern. Then, as now, the lowest groups in the latter Division take a comparatively larger percentage of those found outside its towns than the corresponding groups in the other, the position being reversed in regard to villages belonging to the other two groups.

The Administrative Divisions show striking variations in the distribution of their respective rural populations among the several grades. At either end, the villages of the Quilon Division stand widest apart in the proportions of their populations, as there are, out of a total of one thousand, only nine persons in the group 5,000 and over as against 111 in that under 500, while, in the Kottayam Division, the numbers approach most closely, being respectively 79 and 73. The distribution is fairly uniform in the Devikulam Division. As compared one with another, Padmanabhapuram with 345 per mille takes the first place in the lowest group, Quilon with 664 persons heads the list in the next higher one, 500—2,000, but gives way to Trivandrum (379) followed by Kottayam (378) in the grade above it. Devikulam has the highest number of inhabitants, 148, in the biggest group—5,000 and over.

21 The growth of villages during the decade may be gauged by comparing the number in each population group with that in the corresponding group in 1901. Though the comparison is affected to some extent by the variation in the total number of villages at this Census it is seen, after full allowance is made for the difference, that, with the advance in population, villages that came under the lowest groups ten years ago have largely moved into the higher ones. The marginal statement which summarises the figures for the State as a whole shows that the better class of villages has greatly increased during the past decennium, that villages of between 2,000 and 5,000 inhabitants have advanced by one and a half times, those in the next higher grade 5,000—10,000 have increased by two and a half times, and that there

VILLAGES WITH POPULATION OF	No. in each GROUP	
	1911	1901
Under 500	1,967	1,008
500 — 1,000	851	738
1,000 — 2,000	782	604
2,000 — 5,000	217	115
5,000 — 10,000	20	6
10,000 and over.	1	—

is, at this Census, one village with over 10,000 inhabitants against none in 1901

22. Proximity is the correlative of areality and gives the mean distance between village and village on the supposition of a uniform distribution over the entire country*. This has slightly decreased from 1.50 miles in 1901 to 1.40 at this Census. Both the Natural Divisions share the decrease the proximity in the Western Division being one mile and in the Eastern 1.49 against 1.70 and 1.71 miles respectively at the preceding Census. The Administrative Divisions show variations from Census to Census, except in Kottayam where the distance between one village and another has continued at 1.67 miles. In Trivandrum, it has decreased from 1.47 to 1.45 miles while in Quilon it has gone up from 1.51 miles to 1.53 and in Padmanabhapuram from 0.78 of a mile to 0.79. The greatest variation is found in the Devikulam Division where for reasons already explained, the distance between village and village has declined to 3.31 miles.

23 There are in all 427 *pakuthis* with an average area of 17.78 square miles and an average population of 8,030 souls. In 193 *pakuthis*, the number of inhabitants varies from 5,000 to 10,000, and in 119 it is over 10,000. These together form 73 per cent. of the total number and take in as much as 90 per cent. of the entire population of the State. The group, 2,000—5,000 contains 59 *pakuthis* and 9 per cent. of the total number of inhabitants. *Pakuthis* of the lowest grade *i.e.*, with a population under 500 are only six in number—one in the Quilon Division and the remaining in Devikulam

Houses and House-Room

24 Dwelling houses in Travancore are usually situated within fenced or mud walled enclosures, and lie generally covered in the dankery of the plantain. In Shencottah and in

If d is taken to represent the distance between village and village and n the number of villages in 100 square miles the formula for determining the value of d is $d^2 = \frac{100}{n-1}$

South Travancore, with their collected villages, however, the houses are arranged in rows each being separated from its neighbour on either side by a common wall. This difference in the disposition of houses notwithstanding, no difficulty is experienced in distinguishing a house, which is easily understood as the residence of a joint commensal family. A definition may, therefore, even seem superfluous. But to provide a correct return that would serve as a reliable basis and guide in the enumeration of the resident population, the house was defined, the definition being the same as that at the Census of 1901.

'A house is the dwelling place of one or more families with their resident servants, having a separate principal entrance from the common way.

- i. The common way is not necessarily a public way. Thus servants' go downs in the compounds of large houses, and separate houses situated in one compound which have generally no separate entrances from the public way but have separate entrances from a common way or yard, should be treated as distinct house.
- ii. If two or more separate families who do not take their meals together, live in different rooms of the same house these different rooms will not be taken as separate houses, but only as one house.
- iii. Two or more distinct but contiguous buildings belonging to the same owner but let to different families will be taken as different houses.
- iv. Inns, hospitals, dispensaries and similar institutions which comprise several detached buildings should be entered only as one house."

The proportionate nature of the increase in the number of houses in reference to the growth of population, the agreement between the figures for the last two Censuses and the general uniformity in the number of persons per house in the several Divisions, testify to the ease and accuracy with which the definition has been understood and applied.

25. Apart from facilitating the Census operations, a return of houses has not that statistical value which is associated with it in the West. There, it is utilised to gauge the extent of over-crowding, a sanitary problem of daily-increasing complexity, and the definition of house almost varies from country to country. 'In England and America, the structure or the building is the criterion, in Scotland the manner of its occupation and in France its site.' Here, a house, whatever its structure and however situated or occupied, is more a social unit, and the question of over-crowding in the sense of co-occupation by members extraneous to the family does not generally arise. The joint family either expands over the additional space that may be provided, or breaks up with the result that the dissociated units seek new accommodation and become the centres of new families.

Among the Mummukhatāyom Hindus, the family is matriarchal, i.e., traces its descent from a common ancestress. The tarwad, as the family is called, consists of brothers and sisters and the descendants of the latter along the female line. The eldest male member, called the karavanam, manages the tarwad. In such a system, the wives and children of the male members have no place. It may happen, however, that a karavanam may be allowed to bring in his wife and children to live in the tarwad, but this is not necessary, nor have these any legal status in the family. The male

members who are married usually visit their wives in the houses of the latter. When, however under modern conditions, they feel able and inclined to support themselves living apart from the tarwad, they settle with their wives in houses of their own. In this way the putting up of separate homesteads receives a stimulus. But the tarwad, as such, is split up only when a partition takes place with the consent of all the members. Among the Makhatayom Hindus, the joint family does not generally continue single after the life-time of the parent more especially the male parent. On the death of the father the sons divide and go to live in separate houses with their wives and children, the mother residing with one of the sons in the original household. The unmarried sons, if any usually live with the mother. In regard to the Nampūtiri Brahmans, however the eldest son alone marries, the other sons living with him in the family. The Syrian Christians who form the bulk of the Christian population resemble generally the Makhatayom Hindus in the matter of separate housing.

If occupied houses, therefore vary from decade to decade it may in the circumstances above mentioned, be taken to indicate in some degree the extent to which new families go into separate homesteads. This may be due, as just stated to break up in the original family or to the ability and inclination of its members to set up new houses. But the statistics, by themselves, do not help in measuring exactly the extent of either factor.

20. The total number of houses occupied at the Census was 603,153—
 the Western Natural Division returning 370,501 houses or
 61·3 per cent and the Eastern 232,652 or 38·7 per cent.,
 the ratio being almost the same as at the 1901 Census.

Of the Administrative Divisions, Quilon contains the largest number—230,300 houses or 38·2 per cent. of the total. The Kottayam Division is less by only 12,300 houses—a difference which with an addition of 1,111 gives the total accommodation in the smallest housed Division of Devikulam.

As at the last Census Shertallay with 30,531 houses stands first in the list. Tiruvalla which comes next with 32,181 houses, has exchanged place with Neyyattinkam which stood second at the 1901 enumeration. The smallest number of houses is found in the taluks of Tovala (7,174) Todupuzha (7,635) and Devikulam (4,761). In two taluks more the number is below 10,000 and in ten others, it is between 10,000—20,000. Of the 18 taluks which contain above 20,000 houses only three return numbers exceeding 30,000. On an average there are 20,000 houses per taluk.

27. As compared with the number of houses at the 1901 Census the total now returned shows an excess of 82,261 or 14·2 per cent. While during the last twenty years the increase in accommodation has closely followed the growth in population the difference between the two variations which stood at 3 per cent. at the close of the first decennium has narrowed to 2 per cent. at the end of the second—the ratios at the Censuses of 1901 and 1911 being respectively 1·4 and 1·4 per cent. in regard to houses and 15·4 and 16·2 per cent. in respect of population. The increase in the housing accommodation is thus some ahead of the population increase.

In the Administrative Division the percentages of increase vary from 6·7 in Devikulam at the one end to 11·2 in Punalam at the

other In these and in the Kottayam Division, the ratios correspond with their respective population growths, while a divergence is observed in regard to the other two Divisions But when compared with the ratios at the 1901 enumeration, the Divisions re-arrange themselves, so that while Quilon and Trivandrum maintain almost the same relation from Census to Census, Padmanabhapuram and Kottayam have made up the difference between the rates of increase in houses and in population that obtained at the preceding Census

This feature will be seen to be well brought out if the figures are examined by Natural Divisions Though they divide among themselves, almost equally, the total addition of 82,254 houses, the proportional variation since 1901 is, in the Western Division, only three fourths of that in the other

		VARIATION	
		1911	1901
Western Natural Division	Population	15.9	13.7
	Houses	12.3	10.1
Eastern Natural Division	Population	16.5	17.9
	Houses	16.6	15.0

While the former has kept up the relation found a decade ago between the ratios of increase in houses as well as in inhabitants, the Eastern Division has bridged over all difference and gone even further It may be observed here that the intensity of land culture and the general non-availability of waste areas in the taluks of the littoral belt diminish the facilities for extending accommodation, whenever and wherever required. Moreover, the situation of houses within gardens enables the population concerned to find all the accommodation required within their enclosures In the interior tracts, however, where the development is not complete, the factors that tend to the growth of houses have scope for unfettered play This aspect will be clear if the figures for the component taluks are taken up and compared While, in the comparatively un-opened tracts of the taluks in the interior, houses have risen everywhere along with the population increase, in the sea-board taluks on the other hand, accommodation has been expanding within narrow confines To take six typical taluks from each Division, Kunnathnad, Minachil, Kottayam, Changanachery, Kunnattur and Pattanapuram show an advance in the number of houses *pari passu* with population, but in the taluks of Trivandrum, Chirayinkil, Karunagapalli, Kartikapalli, Shertally and Mavelikara within the littoral area, the increase in houses does not appear to have kept pace.

28 There are on an average five persons to a house—the same as at the 1901 Census The Division figures, however, show some variations The lowest average (4.9) is in the Padmanabhapuram Division and probably bespeaks a readiness there on the part of married couples to set up independent establishments. The highest average of 5.4 in Trivandrum is traceable to the large increase in population and the greater share of children in the family composition, the proportion of children under ten to its total population being 27.9 and higher than in any other Division The high averages in the Quilon and Kottayam Divisions—5.2 and 5.1—may be attributed to the greater living together of the grown-up members within the family, which *per se* is, generally speaking, more affluent and old-worldly than in other Divisions and is not so readily liable to fissions and detachments, so far as they may be traced to the peacelessness of want and to the separatist tendencies of the modern day An examination of the figures for married females in relation to the number of houses throw some light on this point The number of houses per one hundred of married females aged 15 and over varies from 96 and 93 in the Quilon and Kottayam Divisions to 99 in Trivandrum and to 104 in Padmanabhapuram These figures, however,

House-room

have only an approximate value and should not be regarded as exhaustively explaining the variations in house-room.

29 On an average there are 87 houses on every square mile of surface. The variations in the Natural and Administrative Divisions generally follow those of population density decreasing from west to east in the case of the former and from south to north in regard to the latter. Since the 1901 Census, eleven houses have been added to a square mile and give a percentage increase of 14. This increase is shared by all the Administrative Divisions but the ratios vary from 11 per cent. in Padmanabhapuram to 87 per cent. in Devikulam. Dwellings are most crowded in the former Division, being 142 to the square mile and least in the latter—11.

The density of houses in the Western Natural Division is over four times as great as in the Eastern—208 against 49. Though the actual addition since the preceding enumeration has been great in the littoral area, being 28 against 7 the percentage of increase has been less—12 against 17 in the sub-montane tracts.

30 The distance from house to house is 202 yards for the State as a whole and has decreased by 14 yards since 1901. The mean distance in the Eastern Division is over twice as great as in the Western—269 against 131 yards. Houses are most closely situated in the Padmanabhapuram Division where the proximity is 168 yards, while they are widest apart in Devikulam with 578 yards.

CHAPTER II.

MOVEMENT OF POPULATION.

(TABLE II)

Preliminary Discussion

31 Viewed as the test of a people's vitality, this chapter entitled 'Movement of Population' is the most important. The one just closed dwelt on the population as it stood on the day of the Census and covered, therefore, only its static aspect. Here will be considered the population in motion as it were, i. e., in its relation to what it was ten years ago and the circumstances which have brought about the change.

32. The actual population returned at each of the last five Censuses, together with the inter-censal variations for the State as a whole and for the component Administrative and Natural Divisions, is given in Imperial Table II. Provincial Table II contains similar information for taluks. The statistics are reduced to proportions and shown in the following Subsidiary Tables.

Subsidiary Table I—Showing variation in relation to density since 1875

Subsidiary Table II—Showing variation in natural population

Subsidiary Table III—Comparing variation in the natural and actual population with that indicated by the vital statistics returns

Subsidiary Table IV—Showing actual and proportional variation by taluks classified according to density

Six additional Tables are also annexed, embodying the information utilised in discussing the subject-matter of the chapter, and these will be referred to as they are dealt with.

A diagram is appended which compares the population of each Division as actually returned at the five Censuses of 1875, 1881, 1891, 1901 and 1911. A map is also annexed showing the variation, during the last decade, in the taluks comprised in the two Natural Divisions.

33. It has already been remarked that, in its present dimensions, the State is comparatively modern. In regard to the extent to which it was inhabited in former times, no authentic statement can be made. But to one familiar with the country in all its parts, the impression can hardly fail to be strong that, while civil stations or the towns of to-day have had a large accession of strength, the rural parts including the jungle tracts were once peopled in much greater measure than now. The long continued political disquiet, from which the first steady gleam

of light was ushered in by the nineteenth century added to industrial and agricultural depression, are suggested as the possible causes of populational retrogression wherever it did take place. In respect of temples and churches standing in sparsely populated localities, tradition about their having belonged to large and rich congregations seems supported by their wealth and sanctity. In South Travancore, there are instances of villages having been almost deserted within living memory where, the original population first declining what remained shifted to the nearest prosperous town or village. Cases have also occurred of the conversion of such villages into gardens and, under irrigational facilities, into wet lands, thus obliterating all traces of past history. In the mountainous tracts in the interior comprised within the taluks of Pattanapuram, Chengannur Changanachery Minnichil, Todupuzha, &c., the fact that several ruined temples with large estates abound and that almost every peak and every grove has a name and sometimes a local religious fame does not permit the belief that these tracts have remained unwedded to the hand of man since the beginning of time. Reference has been made to this point in the last chapter in connection with the north-eastern Division of Devikulam. The evidences which the local officers have been able to collect are summarised in a Note appended to this Chapter. Without going into the subject at any length which, it must be confessed, the materials to hand do not allow it may safely be stated that there have been large changes in the populational distribution which once obtained. Under altered conditions, however the natural tendency of all populations to increase has been allowed to develop unchecked although their physical efficiency and staying power it would seem, have undergone retrogression with the course of time.

34 In the second decade of the last century was undertaken a pioneer counting of the population, which gave a total of about nine-hundred thousand. The subsequent attempts at enumeration yielded varying results which have been recorded in para 4 of the Introduction. To refer to the rates of growth as deduced from the figures as they are returned, it is seen that, in twenty years, the population increased by 41·2 per cent. while, in the next eighteen years, it went down by 1·4 per cent. But in another twenty-one years, the total number increased by 63·1 per cent. so that by 1875, the year of the first regular Census, the population advanced more than two and a half times from what it was about sixty years previously. As pointed out in the Introduction, the figures on which these ratios are based must not be taken too seriously.

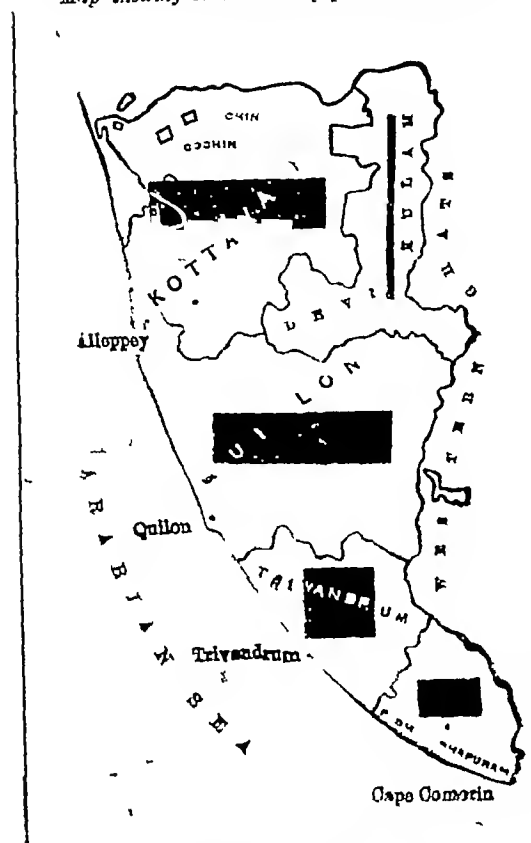

35. The results of the past five enumerations and the rates of increase brought about by them are indicated in the margin. There has been an advance in numbers from Census to Census, the incremental ratios being 8·0 6·5 16·4 and 10·3 respectively. No doubt, with every Census, a higher standard of accuracy was being reached. But the increase in 1901 was unprecedented and while it threw the hypothesis of over-enumeration wholly out of court it made it at the time a laborious and difficult task to ascertain the real growth of population. In view to eliminate all artificial errors that might have led to a fictitious swell enquiry was directed to the conditions of public health during the two periods, 1681—1801 and 1801—1901 and to the other factors which generally tend

Census of	Population.	Increment per cent. since previous Census
1775	8,511,879	
1801	8,401,184	+ 8·9
1821	9,337,736	+ 6·5
1861	9,957,187	+ 16·4
1911	11,425,973	+ 10·3

1681—1801 and 1801—1901 and to the other factors which generally tend

to affect the movement of population

0 - P.C.

An examination of the Census statistics in the light of the results thus arrived at, pointed to the inference that the actual proportional growth in the first of the decades was really larger, and that in the succeeding one smaller, than appeared from the figures. An adjustment made for the several Censuses gave the real rate of progress between 1891 and 1901 as 11.8 per cent against 15.4 as per the returns. As the subject was then fully gone into, it need not be again dealt with here. The discussion in the present chapter may, therefore, be mainly confined to the fluctuation that has taken place during the decennium just passed.

As will be gathered from the marginal abstract, the population of the State has, since the Census of ten years ago, been added to by as many as 476,818 persons, the proportional increment being 16.2 per cent. The map reproduced in the margin describes the movement of population in the Administrative Divisions since 1901. The growth of population revealed is remarkable and no justification is needed for an enquiry into the causes that have contributed to it.

36 Three factors go to produce a variation in population between one Census and another—

Factors regulating variation

- (a) exclusion or inclusion of areas,
- (b) greater accuracy at one enumeration than at another, and
- (c) a real movement in the population

The first element may be left out of account, as no area has been added to or taken away from the State during the decade under review, except 11.64 acres of land in Gothuruthu, Parur taluk, ceded to Cochin under an inter-statal arrangement. In regard to the second factor, it is noted in the first place that the people of Travancore did not at any time show a distrust of their enumeration. While their increasing helpfulness facilitated the taking of the Census, the degree of accuracy depended, of course, primarily upon the efficiency of the agency employed and the effectiveness of the supervision exercised. In the face of record results shown at two successive enumerations, it is superfluous to enter upon a detailed statement on this point. To assume that the present rate of increase which is as high as, if not slightly higher than, the one disclosed at the previous Census, is not all real and should be discounted to the degree to which the gain at that Census was shown to deserve, would only be to push the question of the fluctuation involved over a decade further back. In other words, such an assumption only widens the gulf between the 1891 and 1901 counts still further, and takes away even the modicum of improvement that may be taken to generally accompany each fresh enumeration in the earlier stages of the institution. The arrangements made and the precautions

taken in 1901 were so elaborate and subjected to such close personal supervision, that what the 1911 Census need be considered to have done, was to have kept up to the standard of efficiency then attained. It deserves to be recorded here that the reduction of the village area at the recent re-organization of the Revenue Department and the entrusting of the Revenue staff with the entire conduct of the preliminary operations, made it possible to achieve that end with ease and effect. Increased accuracy of enumeration has, in these circumstances, ceased to be a factor of any striking importance.

There remains to be considered the third of the factors mentioned above namely a real movement in the population. The causes which bring this about are broadly classed under three heads—historical, biological and social. War and other political disturbances are taken to illustrate the influence of historical considerations on the growth or decline of the people. Whatever their value when Travancore, as a political entity was in the formative mould about a century and a half ago, they may now be summarily dismissed from consideration. Under the second factor are ranged physical and mental vitality and the circumstances that bear on it. To the third are appropriated on the one hand “the practices of the people, amongst which may be enumerated the age at, and the universality of marriage, the extent to which widowers and widows remarry the prevalence of abortion and infanticide, and the degree of care and intelligence with which children are ushered into life and brought up, especially during the critical first few months after birth and on the other the physical material or external factors which affect their longevity and fecundity such as famine changes in their general material condition, disease and migration. The biological and social factors, it may be said, touch one another at various points and their operation may be dealt with together. In regard to some of the practices mentioned in the quotation just cited, it may be remarked at once that abortion is seldom heard of as prevalent in Travancore and infanticide never. The pivot of the tarwad and the channel of the hereditary descent of property the woman is prized beyond measure and the barbarous methods of keeping down the family by doing away with the source of its existence and expansion are absolutely repugnant to the instincts, customs and traditions of the population. If in regard to safe delivery and the healthy up-bringing of children, any adverse element operates, it is the lack of knowledge or rather the ways and means more than staid neglect. With the country generously provided with maternity hospitals and trained midwives, however facilities for safe births and the proper care of infantile life are being widened. The number of midwives stationed by the Government in different parts of the country was 14 in 1891-92. It was doubled in ten years, and now the strength stands at 45. On an average 415 women were able to avail themselves of trained medical aid in each year during the period 1891-1901 while in the last decade the number increased five fold. Although it must be said that considerable scope for expansion still exists, the effect of what has been done is bound to tell in its own measure.

37 To begin, then, with the fundamēt of the social factors which it

Marriage customs.

is proposed to examine it may be stated that the married condition is almost universal in Travancore as elsewhere in India. Whether enjoined by religion, encouraged by society or necessitated by domestic requirements, the Hindu the Christian and the Muhammadan differ from one another but little in the observance of this obligation. The composition of the population as determined by this practice is clearly reflected in the statistics of civil condition. All ages taken together there are in a thousand

of the female population, 445 unmarried, 414 married and 141 widowed. In England, which may be taken as typical of Western civilization, the spinsters count up to as many as 586, while the wedded number 340 and the bereaved only 74. This comparison, however, takes in the total population with a varying proportion of children and obviously does not rest on a suitable basis for examining statistics of marriage. To eliminate this defect, the ages above twenty are taken, and it is found that the unmarried, married and widowed stand in the proportion of 298, 576 and 126 in England* as against 44, 684 and 272 in this country. This forward tendency towards the marital tie is further evidenced in the fact that, of the total unmarried females, only 14 per cent are of the ages, 15 and above. If, in view of the general practice among the majority of the population of marrying after the girls are fully grown up, the higher age of 20 is taken, the ratio dwindles down to 5 per cent. Again, of the females of all civil conditions between 15 and 40 years of age, 77 per cent are married while, in the age group 20—40, as many as 83 in a hundred are included in the conjugal nexus. The ratio of women returned as widows is, as seen already, 14 per cent of the total female population. This gives 32 widows to every 10 widowers, a higher ratio than in England where it is as 22 to 10. Between the ages 15—40, the widows number 28 to 10 widowers, and the ratio does not vary if the ages below 15 are also included. The absolute prohibition of widow marriage among some communities and the disfavour with which it is viewed by others who are generally described as "social aspirants", suggest themselves as explanations. These have their effect, no doubt, but in Travancore where divorce when it occurs is free and a second mate is not contraband, a lower proportion would be justified. But, on examining the age constitution of the widowed population, it is seen that in either sex, 50 per cent of the widowed are fifty years old and above, and probably with age in the way, these do not go in for fresh mates and, once their partners had crossed the bar, are content to concentrate their care and love on the young ones growing up by their side. Of this, however, in another chapter. To confine attention to the point under immediate consideration, there is, it will be conceded from what has been mentioned, little exaggeration in the statement that in India, sex differentiation generally achieves its natural fulfilment in marriage. The result is a great increase in the number of births. "It is the universality of marriage," says Mr J. A. Baines, "not the early age at which it is contracted, that is here in question. The latter has sometimes been erroneously put forward as one of the causes of an increase in the child population, whereas its chief and direct effect in India seems to be only to shorten the mean life-time of a generation, and not to increase the number of births per marriage"†. With regard to early marriage and increased child births, it may be said that, apart from its indirect effect through the better ensuing of universality, it has a direct influence by lengthening the reproductive period of wedded life. But, in the present state of physique of Indian womanhood and of the environing conditions, the consequence stated by the writer is not at all improbable.

However, the large increase in the number of births which the practices of the people regarding marriage lead to, is not allowed to go on unchecked. Adverse elements operate to lower the birth-rate or to push up mortality. Attention may, therefore, be directed to the factors such as, public health, material condition of the people and migration which will now be reviewed with special reference to the last decade.

38. The following particulars taken from the annual Administration Reports summarise the condition of the past ten years in regard to season, rainfall and disease. Subdiary Table VI gives for taluks the amount of rainfall in each year of the decade.

- 1901—02. The season was generally good, but less favourable for agriculture than in 1900—01. The total rainfall of the year was in excess of the normal. The month preceding the south west monsoon was exceptionally dry but in the month following there was excessive rain in all parts of the State excepting the Trivandrum and Padmanabhapuram Divisions. The rainfall ranged from 23 inches at Varyūr to 173 inches at Peermade. The average fall was 87 inches. The prices of food-grains showed no appreciable variation. The wages of labour remained almost stationary. Cholera which prevailed in 1900—01 showed a marked decline. There was an abnormal rise in small pox which prevailed during the year in an epidemic form throughout the State.
- 1902—03. The season was generally favourable for agriculture. Throughout the State, the rainfall was heavy particularly during the first four months of the year. The total rainfall was in excess of the normal. It varied from 41 inches at Tamarakulam to 203 inches at Kunnathnad, the average being 100 inches. There was no noticeable variation in the prices of food grains. The wages of labour remained unchanged. Cases of small pox showed a marked decline.
- 1903—04. The season was generally favourable but the rains of the south west monsoon were more than ordinarily heavy. The total fall was in excess of the normal. It varied from 20 inches at Tamarakulam to 240 inches at Peermade, the average being 111 inches. There was no appreciable variation in the prices of food grains or the wages of labour. There was a marked decline in the number of attacks from cholera and small pox and an increase under fever.
- 1904—05. The season was generally unfavourable for agriculture in the Padmanabhapuram, Trivandrum and Quilon Divisions where there was a rise in the prices of food grains. In the Kottayam Division, the season was better and there was no appreciable variation in prices. The total rainfall was below the normal. It varied from 17 inches at Agastivaram to 162 inches at Peermade the average being 74 inches. The wages of labour remained almost stationary. There was a slight increase under small pox, owing to a mild outbreak of the disease in the Northern Districts of the State.
- 1905—06. The season was generally unfavourable for agriculture in the Padmanabhapuram, Trivandrum and Kottayam Divisions and there was a rise in the prices of food grains. The total rainfall was below the normal. It varied from 20 inches at Agastivaram to 176 inches at Peermade the average being 74 inches. There was no marked variation in the wages of labour. There was an epidemic of small pox at Peermade and in the Parur taluk.
- 1906—07. The season was generally favourable for agriculture. The total rainfall during the year was heavy and in excess of the normal. It varied from 37 inches at Agastivaram to 257 inches at Peermade the average being nearly 100 inches. There was a slight rise in the prices of food grains. The wages of labour remained stationary. Cholera prevailed in an epidemic form throughout the State.
- 1907—08. The season was generally favourable. The total rainfall was in excess of the normal. It varied from 23 inches at Agastivaram to 27

inches at Peermade, the average being 87 inches. The prices of food grains continued to rise. The wages of labour remained more or less stationary. Small-pox prevailed in an epidemic form in North Travancore.

1908—'09 The season was normal from an agricultural point of view. The total rainfall was above the normal. It varied from 24 inches at Vairiyūr to 223 inches at Peermade, the average being 88 inches. The prices of food grains remained more or less stationary. There was no perceptible variation in the wages of labour. Small-pox prevailed in an epidemic form in the Quilon and Kottayam Divisions, particularly in the towns of Alleppey and Kottayam.

1909—'10 The season was on the whole a favourable one. The rainfall was normal. It ranged from 20 inches at Vairiyūr to 188 inches at Peermade, the average being 79 inches. The prices of food grains slightly fell. There was no perceptible variation in the wages of labour. Small-pox prevailed during the year.

1910—'11 The season was not favourable for agriculture. The prices of food grains slightly rose. There was no striking variation in the wages of labour. The average rainfall was 98 inches and varied from 18 inches at Vairiyūr to 248 inches at Peermade. Small-pox continued to prevail till about the middle of the year.

The abstract given above shows that public health in general was satisfactory and that check to population in the shape of virulent epidemic diseases was wanting during the last decade. Cholera was prevalent in three years, but in only one year did it become a severe epidemic while, during the period 1891—1901, it covered, in some form or other, as many as eight years, and during 1881—1891, as many as six. In regard to small-pox, the last ten years do not suffer much by comparison with the preceding two decennia. It may be mentioned here that fever, dysentery and diarrhoea usually contribute to the annual mortality in greater degree than cholera and small-pox, but there is nothing to show that they have been in special evidence during the last decade as compared with the previous periods. Apart from these general conclusions deducible from reports, it would be well to measure by means of figures the extent and relative spread of these diseases. Though the registration of deaths and of the causes thereof cannot be said to have been quite accurate or complete, the figures may, in spite of all deficiencies, be taken to indicate, more or less roughly, the direction of the death wave, and as inaccuracy need not be presumed to have affected one particular cause of death more than another, their relative proportions may be taken to hold good as between them

severally. With this qualification, the marginal statement, which gives the mean annual number of deaths under the different heads, may be taken as a portraiture, in outline, of the period concerned. A diagram is also appended which illustrates the comparative incidence of the several diseases. The total number of deaths registered during the decade amounted to 436,476, the minimum for a year being 31,740 and the maximum, 49,948. In a hundred deaths from all causes, fevers take up 26, dysentery and diarrhoea, 13. To cholera are attributed 7 deaths,

while to small-pox the ratio allotted is 6. Of the remaining, two have been put down to fatal injuries, the balance falling under the unclassified list.

ANALYSIS OF MORTUARY RETURNS
FOR THE YEAR 1901—10

Cause of death	Mean for decade	Maximum number
Cholera	3,221	10,508
Small pox	2,939	12,880
Fevers	11,247	15,585
Dysentery and diarrhoea	5,657	10,059
Injuries	691	948
Other causes	19,833	28,529

The attention paid to sanitation and conservancy throughout the State the precautionary measures taken against the out break of epidemics the special arrangements made for supervising fairs and festivals and the progress of vaccination operations generally are features in the attempt to prevent abnormal conditions, which merit notice with reference to the decade. Nor does activity in the interests of public health stand hereto confined. If the leaf of another Department is turned over the endeavour of the State to relieve bodily ailments in normal times and enable the people to prolong the duration of their lives appear in a marked degree. The provision made for obstetric and gynecological aid has already been mentioned. In regard to general medical institutions, the hospitals, asylums and dispensaries maintained by the Government numbered 81 two decades ago, and now they are 58. In view to supplement the aid thus afforded, a system of grants was brought into regular operation about fifteen years ago. The encouragement which this measure has given in the matter of diffusing medical help among the people is seen in the fact that the institutions dispensing European medicine and Vaidiasalas administering indigenous treatment, which totalled 60 at the beginning of the last decennium, rose to 90 at its close. Thus, there are now 138 medical relief institutions under the responsible control of the Government : or an average of more than four to a taluk. To refer to the work done it is seen that 682 720 patients were attended to when the decade opened against 704 696 in the year of the Census, the difference being an increase of 16 4 per cent. But the proportion of those who had to seek help to the total population showed no perceptible increase. On the number enumerated in 1901 the total treated was 331 in a thousand, while the corresponding ratio in 1911 was 392. A decline is noticeable in the ratio of deaths among the in patients in the Government institutions from 6.4 per cent in 1901-02 to 4 per cent in 1910-11. Throughout the last decade the rate of mortality among the in patients has been less than in the corresponding years of the previous decennium the average being 4.3 per cent. against 5.5 per cent.

30 The state of the country from the material standpoint has, it need hardly be remarked, a most intimate bearing on populational development. Though the subject is vast and covers many an important detail it is of limited application to the country at present and even as it is, time and materials are alike against any thing but a sketchy treatment. Two or three main heads need alone be taken up and briefly dealt with. To consider agriculture first, the abstract given in the preceding paragraph says that in seven out of the last ten years the seasons were favourable as against six and five respectively in the two preceding decennia. Only in two years was the rainfall below the normal. The prices of food grains showed no perceptible variations except in the beginning of the second quinquennium, when there was a small rise succeeded however by a fall towards the end of the decade. The extent of land taken up for rice culture and that in which the different kinds of garden produce are raised have already been given in detail in the preceding chapter. It will be seen therefrom that 29.4 per cent of the cultivated area is returned as devoted to rice 8.6 per cent. to palm and other trees and the balance to miscellaneous products. To what extent there has been variation in these areas during the last one or two decades, it is not possible to say as the areas themselves are the first result of a regular Revenue Survey and Settlement only recently closed. Nor can it be said that they represent the state of things at a given time or period, as the Settlement operations extended over a quarter of a century and the final return depicts the condition of the several taluks at different periods. It may be observed, however that in regard to rice culture there does not appear to have been any great extension. It is common experience that for one

reason or another, lands on which paddy used to be grown are being utilised for raising other crops or for purposes other than agricultural. The conversion of such lands into coconut gardens has not been infrequent, especially in Central and North Travancore. But to this tendency to restrict rice, the four southernmost taluks, under the impetus furnished by the completion of the Kodaynar Project, must be an exception. This, however, is of the future. Whatever the extent of rice-lands and the amount of their out-turn, for which by the way no information is available, there is no doubt that local production is insufficient to meet the year's demand. The import of rice and paddy from Madras and far off Burma has, it will be seen presently, been increasing by leaps and bounds. To purchase this necessary of life and furnish some of the others, the produce of the garden provides the only means. Though here, again, exact figures as to the change that has taken place during the last decade are not to hand, it may be safely said that the cultivation is extending everywhere. The western tracts are already full of it, and it is spreading steadily in the interior.

It is to the exporting of these garden products, mostly raw and to a small extent manufactured, and to the import of the absolute necessities of living, that the

Annual average of main items of Exports, Imports, and Revenues for the period 1901-'02 to 1910-'11

Exports (1,000,000 om.)		Imports (1,000,000 om.)	
Total	Rs. 21,200	Total	Rs. 14,180

trade of the country is chiefly confined. An idea of the main articles raised and the volume of the trade in each will be gathered from the statements entered in the margin. By way of further information in respect of trade generally, one or two other items have been added. Figures are also given for a few of the important sources of State Revenue. The first of the abstracts shows the actual mean for the last ten years, and the second the variations in the quinquennial and decennial averages during the last twenty years as compared with the average of

the decade preceding them. The statements speak for themselves. Of the exports, the multifarious produce of the coconut palm occupies the first place. There has been a large increase under each item, but it has been greatest in respect of coconut oil and corn including fibre. Pepper takes the next rank and it is hoped that Travancore may ever retain its claim as an integral part of the 'land of pepper'. The areka seems to grow more in sympathy with seasonal rainfall and its see-saw fluctuations probably evidence the degree of its susceptibility during the period under review. Dry ginger, tamarind and turmeric are other commodities in the expanding trade in agricultural produce. The variation in the export of jaggery, a purely South Travancore industry, is noticeable. It appears to have kept its level in the preceding decade but completely fell through in the last, a circumstance that would deserve enquiry. Molasses, however, is holding its head on and promises to thrive. The seat of its manufacture is towards North Travancore. Coffee has considerably dwindled in importance as an article of growth and of export, though its fluctuations have been less marked now than ten years ago.

Tea on the other hand, has had a prosperous career. The lemon grass oil the

Tobacco						

Note.—In regard to tobacco, revenue and lemon grass oil, the average for the first decade are based on the figures for the first three years in each quinquennium, which alone are available. Columns 3 and 4 have not been filled for tea, as the figures are too hard for the decade previous to 1891-92. The variation for the last decade is, therefore, with reference to the one preceding. The consumption of salt per head is calculated on the total population and that of tobacco on two-thirds, the remaining one-third being taken to represent children and non-smokers.

otton and twist in the closing years of the decade suggestive perhaps of an attempt at meeting by home supply a certain portion of the local demand. Tobacco which in Travancore ranks next to life's necessities, shows a decrease partly attributable to lesser import on account of a temporary enhancement of duty. Its consumption likewise shows a diminution though slight. In the case of salt the consumption has increased greatly during the last ten years.

In regard to factories, mills, &c. worked during the decade it is seen that they have more than doubled. The growth in oil mill and rubber industry has been a feature of the past decennium. Though the mines and minerals worked are few Travancore appears to be one of the few places in India from which plumbago is exported on a large scale. Lately a mineral monazite has been discovered in the sands on the sea-shore about Cape Comorin and the value of the mineral exported last year is stated to have been about one and a half lakhs of rupees.

Improved means of communication is another point which has its own bearing on the material condition. Since the last Census, the length of roads has been largely increased and the total of all kinds, metalled, unmetalled, &c., now measures 4393 miles. If the mountains and hills which occupy a third of the total extent is left out of account there is one mile of road to every mile of area.

79113

There is also along the coast north of Tiruvandrum and thence inland, a permanent water communication of over 160 miles duly maintained

There are several other directions in which an enquiry may profitably be made in view to see how far they reflect the condition of the country, such as private trade, the post and the telegraph, the extent of the reserves, if any, of the people, &c. But the absence of a public bureau fitted and commissioned to work at statistics in all their varied and vital aspects puts such a task entirely out of the question.

From the foregoing, it will be evident that industrialism as pursued in factories has only just begun to grow in Travancore. In regard to the old industrial channel of food-flow, they seem silted up in varying degrees and no efforts are forthcoming to re-habilitate them on any scale. The material position of the people, as at present conditioned, therefore, revolves round the pursuit of the tilling art in its varied forms and of whatever industries closely bear upon it. In other words, a movement in the population depends almost wholly upon the development that is attained in agriculture. This development lies, broadly speaking, in the direction of augmenting the total output of food-supply, either by increasing the amount of yield from the existing area or by enlarging the field of agricultural operations. In regard to the former or intensive cultivation, it may be, as the Director of Agriculture observes in a recent report, that "there is a general awakening throughout the State regarding agricultural improvement. The ryots who have been all along believing that their methods of cultivation are the best, have begun to realise the possibility of improvement in them." But, he continues, "the progress made so far in agricultural improvement is not as much as is to be desired. The chief obstacle that impedes progress is probably the poverty of the ryots." In respect of a people so placed, the question of capability for increasing the productiveness of the soil to any considerable extent can be said to have hardly emerged for consideration, and the widening of the limits of cultivation is, therefore, the only course open. This raises the problem of lateral dispersion of the population. Such dispersion is rendered possible so long as there are fresh lands fit for occupation. The returns of the Revenue Settlement Department show that, of the total arable area, 25.9 per cent still remains to be brought under the plough, of which, the major portion lies in the interior. In the littoral and deltawaters only 8.6 per cent has yet to be taken up while, in the sub-montane and mountainous tracts, suitable only for what is called hill-cultivation, the extent yet untouched is four times, or 35.1 per cent. This region has doubtless its drawbacks, but it is to be noted that the cultivation usually raised here is not easily influenced by small deviations in the quantity or seasonableness of rainfall. At all events, under the tendency to disperse by change of locality, the population in a taluk may either flow towards the uncultivated parts of that taluk or to similar tracts in adjoining ones. In the former case, the degree of dispersion as between one decade and another is not measurable by the Census statistics, as they do not record the changes of habitat within the same taluk area. An idea can, however, be obtained if the area taken up between the two periods could be compared. But the Settlement returns not being a recurring one for each decade furnish only one of the figures for such comparison. In regard to the outward flux from a taluk, its extent may be ascertained from the birth-places returned at the Censuses, and this leads on to the third and last of the factors in connection with variation in population, namely, migration.

40. The subject will receive special consideration in the next Chapter

Here, the figures will be utilised, in so far as they may with

advantage to see how far they explain the increase or decrease in the population enumerated. Generally speaking the movement to and fro is too complex to admit of exact measurement with the available information. Certain general considerations bear on this complexity. As between one enumeration and another the variation in population is affected by the migration that takes place during the interval. But, as the stream of migration runs continuous it is difficult to allocate the exact number to each decade. Even in this case the volume of migration is not to be measured by the mere difference between the returns of two successive Censuses such as they are as allowance has to be made for deaths in the migrant population. Again if the immigration be greater at the beginning of a decennium than at its close it will affect the strength of the population proportionately to the extent of the children born to them. In these circumstances, the gain or loss which results to each Division and taluk from internal migration can only be roughly measured from the Census figures. This will be done when the variations are discussed later on. In connection with this subject another aspect has also to be noticed, namely migration to and from the State viewed as a single unit. In respect of the former the Census gives the necessary particulars. But in regard to emigrants to outside Travancore complete information is not yet to hand in time from all the other Provinces and States. It is not, therefore possible to contrast precisely immigration with emigration for the State as a whole. With the returns till now received, however a balance will be struck between the immigrants and emigrants, and with reference to the corresponding figure of the previous Census, the present gain or loss, as the case may be to the total population, will be duly noted. Without anticipating the results of the analysis of the figures for the whole State or for its component areas, it may be observed that the tendency to migrate whether within the State or outside it, is at present only a tendency and a weak one too.

41. The conditions that influence the growth of population have thus been

dealt with. To focus them through the medium of a brief

recapitulation, they are—the universality of marriage and the high proportion of children that are ushered into existence the non prevalence of artificial methods of keeping down population, the facilities afforded for the care of maternal and infantile life and for the relief of suffering generally in ordinary times, the precautions adopted to minimise the virulence of epidemic attacks, the perceptible effect which these have in protecting life and lengthening its duration, the comparatively greater favourableness of the seasons for agricultural operations the general predominance of garden cultivation and the augmentation of its produce—which represents the purchasing power of the country the marked advance in the quantities of rice and paddy imported the prospect in some parts of an increase of the area under tillage due to additional irrigation and, in other parts of an expansion of the population in the direction of lands lying unworked and finally the satisfactory nature of the public health during the period under review. The majority of the factors enumerated above have been in full force during the last decennium and, in addition to the effect which is all their own, they have accentuated the operation of others which are constant and not special to any period. Viewed from the dynamic point there have been at work a few more factors of value. They have not had time to produce their effect but mark in the fact of their inception the character of the decade. Altogether conditions seem to have favoured an advance in the population commensurate with their range and development.

42 If accurate data were procurable in regard to births and deaths, then sex proportions, the ages at death and the causes of mortality, they would afford the best means of describing, *et cetera*, by means of figures, the circumstances that have furthered life and fecundity and would render it quite feasible to build the conclusion summed up by the Census. But the information available is, firstly, too incomplete to be utilised even for general reference and, in the second place, extremely inaccurate even for the extent it covers. In view, however, of the fact that the subject is of more than passing interest to the Census statistician, a Note on the system of registration is annexed revising, in the light of subsequent changes, the information recorded in the 1901 Census Report. The results, such as they are, are embodied in Subsidiary Table III and will also be commented on.

Though the mortuary returns for the State as a whole thus fail as a guide, the situation is not all forlorn hope. The reconstitution of the conservancy establishments under the Sanitary Commissioner effected some years ago appears to have been taken advantage of by that Officer, and arrangements made through his subordinates for the independent registration of vital statistics in each of the areas conserved under his responsibility. Their boundaries were defined and a Census of their respective populations was taken. This was done in 1903, and from that year separate birth and death returns are being prepared for them. In view to see what light these returns throw on the birth and death rates generally, they have been collated for three years since their preparation was commenced, and shown in Subsidiary Table V. The population under registration was 111,483, and if the figures recorded could be taken as the average for the decade, the rates would seem to work up to 36.7 per thousand per annum in regard to births and 26.9 in the case of deaths, or an excess of the former over the latter of 9.8 per mille per year. This difference appears below the mark and does not correctly measure the extent of population growth throughout the State so as to harmonise with the Census returns. But it should be remembered that the areas observed are quasi-urban and that the period of observation extends only over a short three years towards the close of the decade, which was comparatively less favourable. The figures, however, indicate the trend of advance, and will be referred to later on. In passing, it deserves to be noted that the result attained so far has justified the experiment and derives a special value from the fact that its scope covers places widely distributed throughout the State—eight in the Padmanabhapuram Division, six in Trivandrum, eight in Quilon, and five in Kottayam. But to admit of the statistics so collected being utilized to the full extent, information regarding such important details as age at death, cause of death, &c., should also be recorded.

43 In the absence of the help legitimately due from an accurate register of births and deaths, the discussion of variation figures has to be limited to an examination of the Census returns within themselves, and the distribution of the population by age may be taken to summarise the final results in the operation of the many overt elements that have been at play during the previous decade. The population of the country grows, it need not be re-iterated, by what, in the language of Professor F. H. Giddings, may be termed, 'genetic aggregation' or reproduction, as distinguished from 'congregation' or the incoming of fresh individuals from outside. The former predicates first the existence of the requisite number of married women at the child-bearing ages. Where these are comparatively numerous, an enhanced increase in births may, *ceteris paribus*, be generally expected.

Secondly the growth to be progressive or even to sustain itself requires an adequate excess of births over deaths and deaths may occur at all ages, though usually at the ends of life. Where, therefore, the correlation of the two factors, i. e., the ratios at the reproductive ages between two periods and those of births, is not reflected in the increase of population, the explanation for the variation has to be sought in the degree to which mortality has been in operation. A low death rate at each age-period and a high birth rate are the obvious concomitants of a healthy and prosperous condition of things. At the end of the decade a large number of persons would remain at the two extremities of life and a comparatively small ratio at the reproductive ages. During the succeeding decennium, the birth rate calculated on the total population would stand depressed, but would be high with reference to the number at the child bearing ages while the death rate would rise owing to the mortality among persons who have survived the preceding decade. This backward swing of the pendulum would be lessened or accentuated according as the years that follow are equally fat or comparatively lean. These observations depict in outline the standpoints from which the dynamics of population have to be viewed. To illustrate them three Subsidiary Tables (VII VIII and IX) are appended and the figures embodied therein are very instructive as explanatory of the immediate causes of variation. They will not be reproduced here but the features they indicate will be generally noted.

Discussion of Variation

44 Under each Division, the subject of variation will be considered first by itself and then in relation to density. Finally the component taluks will be briefly dealt with under both the aspects.

General remarks. In this discussion, it is not possible to exhaust all the points of view nor is it necessary to go over the whole ground covered by the statistics collected. The several Subsidiary Tables that bear upon or illustrate the treatment may therefore be referred to in further study of the question. For a correct appreciation of the comparative growth of the people whether in the State as a whole or in any of its parts the physical and other characteristics described in paras 1—3 of the first Chapter as well as the observations made in the preceding paras have to be borne in mind and duly correlated with the Census records. As the population depends almost entirely upon agriculture reference has also been made to the statistics of cultivation as per the latest returns of the Revenue Survey and Settlement Department. The broad figures have been embodied in Tables I A and I B appended to the last Chapter. Further detailed information regarding cultivation, holdings and assessment is given in Table X.

The movement in the population of the Divisions taken as a whole has been described in the State map printed at page 59. In view of considerable divergences within the taluk areas a small map for each Division is given below showing the changes which have occurred in these smaller units during the last decennium. Comparisons of variation and density statistics do not take note of the newly formed and hilly Division of Devikulam.

A ADMINISTRATIVE DIVISIONS

- 4.1. The fluctuations in the population of the Palmanahapuram Division have been irregular in the early periods of the Census. Between 1875 and 1891 the addition to the total number of inhabitants was only 6 per cent. In ten years even this

excess disappeared and the Division showed a decline amounting to 5 per cent.

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	215,313	214,774	191,737	191,178
Immigrants	5,893	6,448	5,462	5,033
Emigrants	8,143	2,655	3,343	2,827
Natural population	218,124	210,931	189,618	191,967

Since 1891, however, there has been a rapid growth. The Census of 1901 recorded a population of 384,575 and an increase of 10.2 per cent, while, in 1911, the number enumerated rose to 430,087, giving even a higher rate of advance, *viz.*, 11.8 per cent. Migration

has been on the positive side in this Division, but the gain on that account does not explain even a full one per cent of the total increase. The movement has, therefore, been one of natural growth, the ratio of 11.8 per cent. being the result of an increase of 29.8 per cent. in persons under ten years of age outweighing a decrease of 18 per cent. in those aged ten and above. While the increase in females has been almost the same at the last two Censuses, the married among them at the child-bearing ages have exceeded the ratio observed in 1901 by 4.2 per cent. Again, a greater number of children has been enumerated now than ten years ago, the absolute and relative increase in the last decade having been much smaller than in the previous decennium. The ratio of children to married women at the ages 15-40 shows, however, no perceptible variation since 1901. In regard to persons at the higher ages, and especially 60 and above, there has occurred a considerable rise, actual and proportional. These and similar features in the constitution of the population suggest the inference that the diminished rate at which children have advanced at this Census is traceable with equal justification to less births and greater mortality, that the actual excess of births over deaths has, however, sufficed to yield the increment disclosed by the previous enumeration, and that the excess increment has to be credited mainly to the comparatively greater longevity of the people at the higher ages.

It was stated, in para 42 *supra*, that special registration of births and deaths was conducted in eight localities in this Division. The net annual increase calculated from these returns comes to 8.4 per mille of the population concerned, and is lower than the Census increment. For the reasons mentioned in that para, the birth and death rates lend but a rough idea. Further, in the present case, in four out of the eight localities, the period of observation was one of heavy mortality and cannot be taken as quite representative of the decade. When allowance is made for this exceptional feature, the rate of increase will stand revised and run parallel with the variation recorded by the Census.

Variation and Density—If a long period is taken, it is seen that, between 1875 and 1911, the Division has succeeded in registering an increase of only 23.4 per cent which is less than one-half of the rate in the Quilon and Kottayam Divisions and is but a little over a third of that in Trivandrum. Nevertheless, the specific population is greatest in this Division, and the absolute increase has been rapid during the last two decades. In 1891, the number per square mile stood at 569, the same as in 1875. But by 1911, as many as 133 persons have been added to that number. The Division is the most cultivated in the State. Of the total culturable area thrown open to the ryot, hardly two per cent remains to be taken up, and wet lands on which double crops are raised as a rule cover as much as 2.2 per cent, the highest ratio in any Division. The climate is healthy and other conditions are not unfavourable. With the Kodayār Project as the cardiac force of South Travancore irrigation, it may not be wide of the mark to anticipate a steady further advance, unless adverse circumstances intervene to disturb a progressive

growth. It may also be mentioned that the area made available for cultivation is only about one-half of the entire extent of the Division.

Of the industries pursued, the most important are weaving lace making and embroidery the manufacture of salt jaggery tiles and coir fibre. Tea and rubber are grown to a small extent, and the fishing industry is largely carried on

Taluka.—An examination of the variations in the population of the component taluks exposes the situation clearly and localises the direction and character of the advance.

Of the five taluks comprised in the Division, the greatest increase, 150 per cent., has occurred in Vilavankod, a narrow strip stretching across the top of the Division from the sea to the Ghats. The growth is almost the same as that shown by the previous Census. Between 1891 and 1901 the addition in density was 10 persons but in the last decade 91 persons have gathered on a square mile. In the absence of a congenial field for the pursuit of industries, it is on land culture that the development of the taluk chiefly depends. With a river never useful for cultivation and now rendered moribund during the wanted seasons by efficient damming and diversion at its higher reaches, the taluk suffers from want of irrigation facilities but with adequate provision for the latter it may quite sustain a greater pressure of population.

About five per cent. of the cultivable area

is outside the reach of the spade and the plough, and this is an additional factor. Francl and Agastivaram, which follow Vilavankod with an increase of over 12 per cent. are both sea board taluks the one situated to the immediate south and the other farther down. The density in these is more than one thousand per square mile the increase since 1901 being 180 persons in Francl and 191 in Agastivaram. The holdings are extremely small in these taluks and the average does not go more than two acres. They contain little or no wastes and are in the forefront of the Kodayar waters. It is here that some of the chief non-agricultural industries of the Division are pursued. The Toraia taluk at the southern most end, which opens out into the adjoining British territory has yielded the smallest increase in population, 65 per cent., while Kalkulam which joins the taluks at either end and is wedged inland between the two coast taluks, comes in with the higher percentage of 85. In these the growth of population has never been uniform and its pressure has been ever faltering. It has taken more than 30 years for Kalkulam to add 23 persons to the hundred and 63 to the square mile while Toraia after many a swing this side and the other has not been able to contribute more than three-fourths of that increase in variation and one half of that accession in density. There is, it must be said, not a cent of waste land there while in Kalkulam, it is one per cent of the arable area. Though the Kodayar irrigation benefits these taluks there appears something strange at least about Toraia. With the highest proportion in the Division of the wedded females at the census 1901 the ratio of children is less than in any other taluk here or elsewhere in the

State In spite of their all-absorbing cultivation, the people seem to halt at every turn and gasp for facilities for increase and spread Unless fresh lands emerge or cultivation goes deep, the outlook does not appear promising It may be added that the land made available for occupation and agriculture in the whole taluk represents only a third of its extent, or as much as 64 per cent, if the mountains, hills and forests be excluded from the calculation

46 The present Census has returned a population of 557,865 in the Trivandrum Division, against 456,082 persons enumerated in it ten years previously The percentage of increase works up to 22.3, a ratio greater than that displayed by any other Division At the preceding

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	231,225	276,640	229,393	225,859
Immigrants	10,118	6,958	10,071	6,280
Emigrants	4,721	4,905	4,169	8,279
Natural population	276,893	274,593	223,472	222,403

Census too, Trivandrum held the first place with an increase of 20.9 per cent Unlike in Padmanabhapuram, the variation has all along been on the side of advance, though the incremental ratios were small in the inter-

censal periods comprised between 1875 and 1891, 3.1 per cent in 1875-'81 and 6.6 per cent in 1881-'91 In regard to the number of immigrants, they show a rise since 1901, but the greater outflow of emigrants has resulted in a net loss to the Division, though slight It is the natural increase that has contributed to the great advance disclosed by the Census, and the rate at which it has progressed is confirmed by the register of births and deaths in the six localities of this Division referred to in para 42 *supra*—which yields an average annual excess of the former over the latter to the amount of 14.6 per mille Not only have females increased at a slightly higher rate than males, but a small excess within the ratio of female increase is observable in respect of married ones at the reproductive ages The proportion of these latter to the total of the sex at the same ages is, however, smallest in this Division and exhibits a gradual diminution from Census to Census This notwithstanding, the number of children under 10 to the married women at 15-40 is greater than in the other Divisions and the proportion has been rapidly increasing from decade to decade Again, the rate of increase in the numbers at the higher ages has been marked throughout Further, the population now enumerated at the ages 10 and above, when compared with the total censused in 1901, shows a decrease by death or emigration, which latter however is an inappreciable factor, of but 11.8 per cent, a proportion smaller than that returned by the other Divisions These circumstances suggest the increasing care with which infant life is being guarded in this Division, the comparatively ample facilities afforded therefor and the conditions which favour longevity in general

Variation and Density—Of all the Divisions in the State, Trivandrum has registered the greatest increase in population since 1875, namely, 62.5 per cent It offers an interesting comparison with its southern neighbour, in regard to variation as well as density Not to go back to the earlier Censuses, while Padmanabhapuram was oscillating now in the direction of advance and then on the side of retrogression, and Trivandrum was slowly progressing, it may be stated that, since 1891, the latter has been marching at double the rate of the former In regard to density, it is seen that, during 1875-1911, the former Division only managed to restore its strength to the original level, while Trivandrum was distinctly able to add as many as 41 persons to the square mile During the last two decades, the latter took in 60 more on a square mile to every one hundred

added by the Southern Division. If its potentialities, agricultural or other are fully developed, it may with the added facilities of a Head-quarter Division outstrip its rival. The proportion of the cultivable area to the total is here at the maximum and the ratio of the area cultivated to the extent available for cultivation at the minimum. This opens an encouraging prospect. Except an oil mill or two and a few tea factories, industries on the modern pattern appear limited. Ponnudi tea is far famed and plum-bago mining in Travancore is centred in this Division. The manufacture of lemon grass oil so much in demand abroad, is being pursued half heartedly in a few places. As the connecting link between South and North Travancore this Division offers great facilities for the creation and expansion of large trade activities.

Taluk.—The four taluks into which the Division is divided come in for

Map of Travancore Division

a considerable share of the aggregate advance in the population. The sparsely inhabited taluk of Nedumangad which lies in the interior shows the greatest increase 30·1 per cent. The industries of the Division are more or less, confined to this taluk, which has gained by migration to the extent of about 6 per cent. Even if this is deducted, the ratio stands higher than in 1901 and the taluk itself does not go lower down than the second place. But the scope which it affords for raising the means of subsistence does not appear to be fully utilised. Though the proportion of cultivable area is, of the 83 taluks in the State, greatest in Nedumangad, and is equally so in regard to waste lands if one taluk alone is left out of the comparison, the land under tillage does not work up to even one-half of the arable area. It

may not be surprising therefore that, with cultivation thus severely delimited, the taluk should advance so slowly in its specific population as to be able to add only a little over one hundred persons to the square mile in the course of 3 years. Seasonal rainfall is the main source of water-supply and the future of the taluk appears to hinge on the extent of conservation whenever the rains fall. Next to Nedumangad come in order Neyyattinkara and Chirayinkil on either side and Trivandrum in front with percentage increases of 20·0, 20·4 and 15·6 respectively. All these are sea board taluks, and the first named which borders the Southern Division and runs up to the Ghats parallel to Vavankod is like that taluk both mountainous and sub-montane. Natural growth has been at a high rate in all the three taluks while in respect of every one of them especially Neyyattinkara, migration has operated as a negative factor. They possess extremely prolific populations the number of children under ten varying from 30 to over 50 thousand, and the lower limit being higher than the corresponding figure in 21 out of the remaining 23 taluks. This position will be seen to be maintained even if the proportion on the total population are taken and compared. In regard to density Neyyattinkara and Chirayinkil have shown increases since 1870 of over 300 persons and Trivandrum

has been able to pile on 200 more. The unculturable lands constitute but a small portion, the taluks standing in the order given above in regard to their respective ratios. The extent of unassigned waste to the total area, however, has narrowed in Neyyattinkara, being but 7 per cent, while in the other two taluks, it forms as much as 26 to 30 per cent. The high specific population of these taluks notwithstanding, further accessions are possible, for which the provision of irrigation facilities and industrial aids will serve as an effective stimulus.

47 The population of the Quilon Division rose from 1,070,283 in 1901 to 1,233,360 in 1911, or by 15.2 per cent. The actual increase has been largest in this Division, though in point of proportional advance, Quilon yields the palm to her head-quarter sister. But it

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	620,773	612,587	539,495	530,791
Immigrants	9,596	11,399	14,874	11,657
Emigrants	7,043	5,131	6,764	4,515
Natural population	618,219	606,319	531,375	523,649

is noteworthy that the advance of population has been sure and steady all along. The increase in the previous decade was 12.2 per cent, and in that preceding 1891, 10 per cent, while in the first inter-censal decade, 1875-'81, the addition was 4.1 per cent. The

growth of population during the last decennium has been entirely from the home-born, the Division having lost by migratory movements. While, in the ten years between 1891 and 1901, males increased at a more rapid rate than females, this Census has reversed the position. The proportion of the married of the fair sex at the ages 15-40 to the total number of females enumerated in these ages, stands higher than in any other Division except Kottayam and, in respect of the latter, the shortage observable in the ratio of increase at this Census as compared with the previous one is greater than in Quilon. An examination of the age constitution of the population shows that, in all the age-periods except 15-40, there has been in 1911 a larger addition than in the previous Census. Even in respect of the exception referred to, the difference in the incremental ratios has been only nominal. Again, children under ten have now risen by 18.9 per cent, against 15.5 per cent in 1891-1901. In regard to persons aged 60 and above, the increase has also been considerable. Generally speaking, therefore, it may be said that great excess in births coupled with diminished mortality at the different age-periods explain the increase in the population recorded by the Census. No safe comparison appears possible with the special vital statistics returns. In five of the eight places taken up in this Division, the public health appears to have been unfavourable during the period to which the figures relate, as is seen from their high death-rates. The birth-rates too in some of them naturally appear low.

Variation and Density—Since 1875, the Division has recorded a total increase of 48.1 per cent. The rate of advance in population and in density has all along been one of unbroken increase. In the ten years following 1881, as many as 34 persons were added to the square mile. In the succeeding decade, there was a rise to 45, and at this Census, the increase to density has been 64 persons to the square mile. Since 1875, the total addition to the specific population has been 156, slightly less than in Kottayam, which has registered the same rate of population growth. The Division contains some of the richest and most populous taluks. Though the proportion of the net cultivated to the arable area is high, there is still 30 per cent more awaiting occupation, whose actual extent, it may be added, is considerably greater than

in the other Divisions. A good portion of the industry and trade of the country belongs to this Division and coir and tile works, rice and oil mills tea and rubber plantations and factories are mostly found here. Judged from the progressive advance in density and the facilities provided for development, it is not improbable therefore that Quilon will in time outbeat its northern rival, Kottayam, in point of its capacity to support a greater number of persons, area for area.

Taluk—The variations in the population of the eleven taluks included

Map of Quilon Division.

- | | | |
|-----------------|-----------------|-----------------|
| 1 Kottarakkott | 4 Karunagapalli | 9 Changanassery |
| 2 Pattanamparam | 5 Karunagapalli | 10 Tiruvalla |
| 3 Kollam | 6 Kollam | 11 Ambalapuzha |
| 4 Quilon | 7 Mavelikara | |

in this Division cover a wide range from a decrease of 1·7 per cent in Shenkottah beyond the ghats to an increase of 26·3 per cent in littoral Quilon. There have been equally striking fluctuations in the rates of growth at the past Censuses, not only between the taluks as compared with one another but also in regard to each taluk from decade to decade. The taluks with the greatest densities show high rates of growth as in the seaboard taluks of Quilon, Karunagapalli and Kartikapalli which are situated in order north of the Trivandrum Division and in deltaic Mavelikara and Tiruvalla. The most crowded

taluks in the State are here Karunagapalli with 1,514 persons to the square mile and Kartikapalli with 1,503 persons. The variations in these taluks since 1901 have been 10·5 and 15·3 per cent. respectively and the additions to density 147 and 102. They contain no assignable wastes and the cultivated areas form very high percentages. Mavelikara comes next with a density of 1,173 and an increase of 125 persons since 1901. Its rate of population growth has been higher than in Karunagapalli, being 11·9 per cent. Quilon and Tiruvalla are the remaining taluks with densities above one thousand. In these the movement of population has been greater than in any other taluk of the Division, 26·3 per cent in Quilon and 23·3 per cent in Tiruvalla. They appear to evidence the general tendency for population to grow irrespective of the size already attained in relation to area, provided conditions are favourable. To this, however, Ambalapuzha may be taken as an exception. It contains the highest ratio of culturable lands and is utilizing all the available area. Here rice culture predominates, and the rice and oil mills and the coir yarn factories of the Division are mostly in this taluk. But the unculturable areas form comparatively large ratios and it has not been supporting as many persons as its southern neighbours where garden cultivation is more largely resorted to. The density which now stands at 9·5 persons on a square mile has been increased by only 20·6 since 1875, while Kartikapalli has added as many as 1·1 during the same period. Quilon 4·3 and Karunagapalli 1·1. Probably in

favourable conditions interpose to check large accessions, of which, however, no precise information can be got at. It may be noted that moist heat is against healthy life or active fecundity, and in water-girt Ambalapuzha with its parched sands, the stagnant pools of rotten cocoanut debris constitute an aggravating condition, as in the allied but more rural taluk of Shertallay. In the interior of the Division, Kottarakara, Chengannur, Pattanapuram and Kunnattur have returned increases in population at the rate of 17.2, 16.5, 14.5, and 11.8 per cent respectively. In regard to the amount of variation in density since 1901, the taluks preserve the same order, except Kunnattur which takes a second place in this respect. The pressure is highest in Kunnattur (533) and Kottarakara (447) and lowest in Chengannur (137) and Pattanapuram (133). These taluks monopolise, to a greater or less extent, the activities connected with the growth of the tea and rubber industries in this Division. One more taluk remains to be noticed—Shencottah with its small density and decreasing variation. The completed Railway has taken away the large immigrant population censused in 1901, and the increase of 21.4 per cent in its total population, which the taluk then disclosed, has been converted into a decrease of 1.7 per cent at this Census. So far as the pressure of population is concerned, Shencottah appears to be a reproduction of Tovala on the other side of the Ghâts. But the balance of comparison inclines slightly in favour of the former taluk. The uncultivable area is less than in Tovala, and there is in Shencottah a small percentage of waste lands yet available for occupation. Between 1875 and 1911, it increased its density by 74 persons, as against 42 added by Tovala. However, the advance appears to be made with a hesitating step. The increase has never been uniform and during the last decade there has been a thinning out. Altogether, in this taluk, the conditions which immediately affect life and fecundity cannot be said to be very favourable to rapid growth of population, viewed by itself or in relation to the territory occupied.

48 As in the Trivandrum Division, the growth of population in Kottayam Division, was very slow till the year 1891, the rate of advance having been 5 per cent in the period 1875—'81, as well as in the ten years that followed. In the succeeding decade, however, the increase

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	576,060	563,041	516,215	503,802
Immigrants	9,027	9,445	7,987	8,129
Emigrants	6,037	4,856	6,457	4,719
Natural population	573,070	557,952	515,215	499,472

was phenomenal, being 18 per cent. Since 1901, there has been a further gain of 14 per cent and the population now stands at 1,139,101, against 999,607 at the previous Census. This satisfactory result is due, as in the other Divisions, to the excess of births over deaths, the

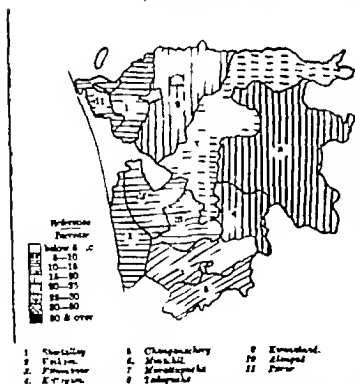

gain by migration being but slight. Females have advanced almost *pari passu* with males—14.1 as compared with 13.8 per cent. Judged by the statistics of civil condition, the Division might have returned a higher ratio of population increase than 14 per cent. In spite of the fact that the percentage of increase among married females at the ages 15-40, was considerably less in the last decade than in the previous one, their proportion to the total of the sex at those ages stands higher than in any other Division, and is almost the same as in 1901. But the ratio of children under ten to the wedded at the child-bearing ages is seen to be smallest in this Division. Again, of the number of persons enumerated in 1901, there was a decrease in 1911 of 15.5 per cent, a proportion less only than that in the Padmanabhapuram Division, which stands last in respect of population growth. However, that the Kottayam Division has correctly registered its population is evident from the circumstance that the percentage of increase has been as high as 10.4 in the five localities for which vital

statistics have been specially arranged to be collected—places, be it noted subject to comparatively high mortality during the limited period of observation.

Variation and Density—Though, when compared with Quilon the intercensal rates of growth have by no means been steady and uniform the Division has finally managed to march abreast of it, the proportional advance since 1875 being 48 per cent. The addition to the specific population in the entire period 1875-1911 has been slightly higher than in Quilon, being 160 against 156. During the last decade, however the addition to density has been less, being 63 against 64 but the variation in population has been the same in both the Divisions. Though the Division is the most hilly it is favourable to the growth of palms and other miscellaneous garden produce. In respect of the percentage of cultivated area to the cultivable total the Division comes next only to Padmanabhapuram and, in regard to the ratio of the arable extent to the total next only to Trivandrum. Oil mills are worked in a few taluks and rubber plantations are reared in some others. With a wealth of variety in its forests, which offers a tempting field for capital and labour the capacity of the Division for development is great in the direction of industry and trade and with the consequent improvement in general material condition, the pressure of population is bound to advance at a more rapid rate. If therefore the Kottayam Division does not allow its children to fill out or permits them to flow away the blame will not rest for some time to come on want of scope for profitable activity at home.

Taluks—The variations in the population of the taluks in this Division have been considerable throughout though, as between themselves the ratios differ

Map of Kottayam Division.

to a great extent. In every one of them the rates of increase have been very marked during the last twenty years as compared with the previous intercensal periods. For purposes of detailed notice the eleven taluks of the Division may be broadly classed under three groups according to their physical situation—the littoral group which takes in Sertallay and Parur the mountainous which comprises the inmost taluks of Muvattupuzha and Muvattupuzha and lastly the sub-montane and sub-littoral which includes Changanachery Kottayam Ettomannur Vaikam Kunnathod and Alangad.

To take up the first group Sertallay and Parur are the most thickly peopled in the Division the densities being 1,377 and 1,491 respectively. These are the two taluks where the pressure exceeds one thousand persons to the square mile.

the density in Vaikam which is the next most crowded taluk being only 859. Since 1901 and 1875, Shertallay has grown by 11.1 and 36.2 per cent and Parur by 14 and 29.6 per cent respectively. The addition per square mile during 1875—1911 has been 353 in the former taluk and 341 in the latter. Shertallay is about twice the size of Parur in area and population. The cocoanut palm flourishes most luxuriantly and oil and rice mills are also worked in that taluk. It is, however, a low-lying, sandy and swampy tract and the seat of elephantiasis. Leprosy is comparatively more frequent here than in the other taluks of the State. Parur is the meeting place of Cochin and Travancore. It has received more immigrants than any other taluk in the Division, and has sent out a lesser number of emigrants than any except Todupuzha. It has to be noted that, of the immigrants, females predominate.

Of the taluks in the second group, Todupuzha has gained most by immigration, 12 per cent, while Minachil and Muvattupuzha have lost by this means. The percentages of variation during the last decade are respectively 18, 19.4 and 8.4. Notwithstanding its high rate of growth at this and the previous Census, Todupuzha is the most sparsely populated taluk in the State, the density being 68 persons on a square mile. An increase of 64.5 per cent, to its total population since 1875 has only meant an addition during this long period of 26 persons to the square mile. Minachil and Muvattupuzha have advanced by 55.9 and 51 per cent respectively since 1875, and have added 210 and 90 persons respectively to their specific populations. Todupuzha has the smallest percentage of cultivated area and Minachil, the largest. These two taluks with the contiguous taluks of Muvattupuzha and Changanachery almost divide among themselves the rubber plantations of the Division.

The last group, which covers the remaining six taluks of the Division, shows considerable divergences in the rates of growth. Changanachery takes the lead with an increase during the last decade of 21.9 per cent, followed by Kottayam with a percentage of 20.7. Kunnathnad has registered an increase of 16.7 per cent and Alangad 12 per cent. The taluks that have grown the least, are Ettumanur (10.3) and Vaikam (9.8). It is the natural increase that has mainly brought about the growth of population in all these taluks, except in Kunnathnad where about 8 per cent of the variation was due to the gain by migratory movements. In regard to the number of persons added to a square mile during the last ten years, the taluks stand arranged in the same order as given above, with the exception of Kunnathnad which takes the last place. The order of the taluks, however, is inverted if their present specific populations are compared with one another, Kunnathnad still coming at the bottom of the list. Vaikam with a density of 859 persons is the most crowded in this group, and Kunnathnad the least with 404 persons to the square mile. Vaikam and Ettumanur contain practically no waste land, but in the former with a diminutive ocean in its Vēmbanād estuary, the percentage of unculturable area is much higher than in any other taluk in the whole Division. One-half of the oil mills of the Division, it may be added, are in the Vaikam taluk. In regard to the other taluks, Changanachery with a large percentage of culturable wastes possesses ample scope for development, and the same may be said to a lesser extent of Kunnathnad.

49 As stated in the previous Chapter, Devikulam was constituted as a separate Division for all purposes of Revenue administration only during the last decennium. In view to enable comparison, its population at the previous Censuses has been

Devikulam
Division,

adjusted with reference to the present area. As the result of such calculation, the number of inhabitants is seen to have stood at 41,610 in 1901 and has now advanced to 68,833 giving a percentage increase of 64·8, the highest among all the Administrative Divisions. With this extraordinary growth nevertheless, the Division has added

POPULATION	1911.		1901.	
	Males.	Females.	Males.	Females.
Actual population	87,993	80,870	32,738	8,851
Immigrants	17,725	13,144	19,783	8,851
Emigrants	18	30		
Natural population	80,253	17,696		

only 23 persons to the square mile since 1901 and the density now stands at the halting figure of 55. The addition to the specific population from Census to Census has been by almost imperceptible degrees, 83 years having had to operate to produce an increment of 41 persons. Imbedded in the mountains, Devikulam has its hills and forests up to two-thirds of the entire area and of the remainder only a fifth is under cultivation. The Division, however is the home of tea and the movement in its population depends mainly on the growth or decline of this industry. How far the industrial and agricultural pursuits of the Division have attracted the outside population may be ascertained by an examination of the birth-place returns. Of the total number of persons now enumerated within the Division, as many as 30,812 are immigrants, as against 21,569 at the Census of 1901. In regard to emigrants, it is not possible to adjust the figures for 1901 as separate birth place statistics are not available for the areas which have been constituted into the Division. However as very few are seen to have left the Division at this Census, it may be inferred that the district that tempts workers from outside does not find it hard to retain what it produces. A gain of over 25 per cent may be put down as the net result of the two migratory movements, and judged by the present condition of things, good luck may be confidently predicted for this most recent addition to the Administrative Divisions of the State.

Taluks.—In regard to the two taluks which go to constitute the Division there is not much to be said of a specific kind. With an increase of 103·6 per cent. in its population, the taluk of Devikulam has been able to add, since 1901 only 20 persons to the square mile and the other taluk Peermade has increased its density by 74 persons, the increase to its population being however only 40·9 per cent. Of the arable area the cultivated portion forms 6 per cent in the former taluk against 33 per cent. in the latter. In view of the high proportion of wastes in Devikulam the spread of cultivation is full of promise.

In regard to the Devikulam taluk it may be added that about a third of the total area of 62½ square miles has been leased to the Kannan Devan Hills Produce Company (Anglo-American Direct Tea Trading Company Ltd.) under a concession enabling them to gradually extend cultivation without the liability to immediate taxation over the whole assigned area. Exact figures are not ready

at hand regarding the development of the concession during the last decade. How

ever, from the latest information available, it is seen that there are more than two dozen estates within the area known as Kannan Devan Hills and that tea takes up 16,776 acres and coffee 946 acres. Including the lands under occupation, the total amounts to roughly 38 square miles. The number of hands employed aggregates 15,172, and the out-turn in the year, 17,856 bushels of coffee and over 7½ million pounds of tea.

B Natural Divisions

50 The two Natural Divisions into which the State has been divided will now be noticed. A diagram is given below describing the variation per 1,000 of the population at the last four Censuses, in each Natural Division and in the State as a whole. The rate of development since 1875 shows a progressive move, more marked in the

WESTERN NATURAL DIVISION

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	994,826	981,838	849,070	841,531
Immigrants	15,737	19,522	16,143	15,929
Emigrants	19,616	19,624	15,331	15,144
Natural population	998,205	981,930	849,258	840,752

EASTERN NATURAL DIVISION

POPULATION	1911		1901	
	Males	Females	Males	Females
Actual population	737,037	715,784	641,035	620,461
Immigrants	41,323	40,803	35,784	31,634
Emigrants	6,512	9,874	6,193	7,918
Natural population	702,820	685,855	611,499	596,745

Eastern than in the Western Division. Between 1875 and 1881, the former advanced at 5.8 per cent, and the latter at less than one-half of that rate. During the two succeeding decades, the increases registered were 7.5 and 17.9 per cent in the Eastern Division against 5.8 and 13.7 per cent respectively in the Western. The percentage of growth recorded at this Census has been the greatest, being 16.5 in the interior tracts and 15.9 in the littoral areas. If the ratios for all the Censuses are put together, it is seen that, since 1875, the

population of the first named Division has increased by 56.2 per cent, and that of the second or Western Division, by 43 per cent. So far as the last decade is concerned, the migration figures show that there has been a gain to the Eastern Division to the extent of 9 per cent, while the other Division has, on the whole, suffered a loss, though insignificant. With the allowance made for the variation brought about by the migratory movements such as they are, the ratios of natural growth in the two Divisions become equalised. For an examination of the statistics of age, sex and civil condition which may go to explain this development, the Subsidiary Tables may be referred to. To notice them briefly, females have advanced in the Eastern Division at a slightly more rapid pace than males, while the reverse is the case in the Western tracts. Among married females at the ages 15-40,

the percentage of increase is far less in the Eastern Division than in the Western, being 10.7 against 14.5. But the proportion of these to a thousand of the sex at the same ages is higher in the former than in the latter Division—796 against

747 However the number of children under ten to one hundred married women at the reproductive ages is slightly less—168 in the Eastern as compared with 172 in the Western Division, where the increase in the total number of children during the last ten years has also been greater. In regard to the persons enumerated above the age of ten the Eastern Division exhibits a decrease of 15 per cent. on its total population of 1,501 while, in the other the percentage of decline amounts to 15.8. In respect of the ages 40-60 the figures show the same rates of growth for the two Divisions, while, at the other periods, the increase has been much greater in the Western than in the Eastern Division. From these general features, it may be inferred that, as between births and deaths, the former are more numerous in the littoral and deltaic areas, and the latter more active in the mountainous and sub-montane tracts.

Variation and Density—Though the growth of population has been greater at each Census in the Eastern than in the Western Division, the position is inverted in regard to the increase in density. Between 1875 and 1911 the Western Division has added as many as 325 persons to a square mile against an increase of 91 persons in the Eastern Division. If the last decade be viewed separately the increase in the former Division has been four times that in the latter being 148 against 36.

The variations in the taluks of each Natural Division classified accord-

Actual variation.		Proportion of increase.	
		Taluks with density of	
Eastern Ratio of Increase in 1911	750—900	600—750

ing to density brings out certain characteristics illustrative of their comparative growth. The abstract in the margin summarises the order of the density groups with reference to the absolute and proportional increases in the component taluks the figures for which are embodied in Subsidiary Table IV. The statement is self-explanatory. In the Western Natural Division, the greatest actual

increment as well as the greatest proportional advance are presented by taluks with already high densities, while in the Eastern Natural Division the taluks with a comparatively low specific population show the greatest development from either standpoint. In the interior too yet sparsely inhabited tracts are evidently drawing and producing an increasing population while in the littoral and deltaic areas, the favourable conditions which have rendered service in the past continue to function with uninterrupted force.

C Summary

51 The changes that have taken place in the population of the Administrative units were first considered, and it was seen that the progress disclosed by each Division was the outcome of considerable divergences in the smaller taluk areas. To gain a general aspect of the population advancement the two Natural Divisions which typify among themselves certain physical and other characteristics were next taken up and the variation figures relating to them briefly noticed. Now the general results so arrived at will be summarised for the whole State and passed in review. In the diagram given in the preceding paragraph have been described graphically the inter-censal variations since 1875.

Since the year 1901 Travancore has grown in population to the extent of 476,618 souls or 16.2 per cent. Males have increased by 241,198 and

females by 235,620, the incremental percentages for either sex being the same as for the population as a whole. Of the two causes which have contributed to this advance, namely, natural growth and migration, the latter may first be referred to.

The returns of birth-place show that 61,165 persons born elsewhere were enumerated in this State and that 26,123 persons born here were censused in other parts of India. The former represents an excess of 6,262 and the latter of, 1,633 over the corresponding figures of 1901. But these statistics do not give an accurate measure of the movements to and fro. In the first place, as observed in para 40 *supra*, the record of emigrants is not quite complete. Secondly, no allowance is made for diminution by deaths among the migrants. The former defect, however, does not necessarily vitiate a comparison of the present figure with that of the preceding Census, as returns have now been received from those Provinces and States which supplied the information in 1901 and as these appear to almost exhaust the list of importing places. The total as compiled and recorded may, therefore, be taken to indicate the volume of emigration with the nearest approach to accuracy. In regard to the allowance for deaths, the following method* is adopted to estimate the number that must have migrated to produce the increases shown in the returns. To take the case of immigrants, 54,903 persons were enumerated as foreign-born at the Census of 1901. Of these, many must have died since. If a death rate of 30 per mille is assumed as a tolerably fair ratio,† it would have carried off 16,471 persons in the course of ten years. Even if, in 1911, the number of foreign-born had remained the same as in 1901, as many as 16,471 must have newly entered the country during the decade to recoup the loss caused by deaths. But, as a matter of fact, the foreigners have risen at this Census by 6,262. The annual immigration necessary merely to produce this latter excess comes to 737.57 persons‡ or 7,376 in the decennium. The sum of the two figures gives 23,847 as the number of persons that must have come into the State, not only to fill up the gaps caused by deaths but also to provide the surplus disclosed at this Census. A similar calculation in regard to emigrants from among the home-born gives an exodus of 9,270 individuals to fill death vacancies outside and to provide the increase found in the returns received. Balancing the ebb and flow of migrants, there is a net gain to the State of 14,577 persons, which represents the contribution on this account towards the total increase of population. All this however amounts to a proportional addition of but 5 per cent on the 1901 population, and may be left out of the reckoning in the large increase of 16.2 per cent registered by the Census.

Turning to the natural growth of the indigenous population, the preliminary discussion has shown that there has been nothing to check the natural tendency of the people to multiply at a rapid rate, and that the condition of the country during the last decade has not been such as to falsify such advance. The internal evidence furnished by the Census appears to strongly support this stand of the population question. By way of gauging the character and weight of this evidence, the

* *Vide* page 102 of the Bengal Census Report, 1901. There is another method given by Dr G. B. Longstaff in his 'Studies in Statistics.' According to it, the arithmetical mean between the migrant population at the beginning and that at the end of the decennium is taken and on this average population, the number of deaths that must have occurred among the migrants is calculated as per the assumed rate of mortality. To the figure thus arrived at, is added the actual Census increase and the total is taken as the number of migrants during the ten years. The method followed in the text is preferred, as it makes full allowance for deaths on the excess number of immigrants censused, which the other method does not.

† 27 per mille is the rate of mortality yielded by the returns of certain representative localities whose birth and death statistics are utilized in discussing the subject of variation in general. *Vide* Subsidiary Table V. To be on the safe side, a higher rate is taken.

‡ Let X = the number of immigrants in each year and 0.30 (i.e., 30 per 1,000) the death rate. Then the number surviving at the end of one year is $X \times .970$, at the end of two years $X \times (.970)^2$ and so on. The total number of new immigrants at the end of the decade will be $X (.970^{10} + .970^9 + \dots + .970 + 1)$ which, we know, equals 6,262. Hence $X = 6262 / 8.49 = 737.57$.

statistics of age and civil condition may be examined. They will throw considerable light on the extent to which marriages and births have determined the composition of the population and the directions in which death has been at work in counteracting their effects.

The age returns of this and the previous Censuses, which are summarised in the margin give the variation per cent. at each period between one Census and another and the ratio at each to the total population. It is seen therefrom

Variation per cent. in certain age-periods.

Age period	1901—1881	1901—1901	1881—1891
0—10	+ 15.1	+ 21.8	0.6
10—20	+ 19.1	+ 17.0	8.1
20—30	+ 12.2	+ 18.2	+ 30.9
30—40	+ 10.8	+ 13.4	+ 14.8
40—50	+ 14.0	+ 11.8	+ 10.7
50—60	+ 12.8	+ 8.8	+ 10.2
60 & over	+ 17.8	+ 0.4	+ 30.7

that the population of 1911 is largely made up of persons at the earlier and later years of life and that while the former have so multiplied as to be able not only to replace the numbers snatched away by death but also to leave a large reserve the latter have weathered the storms and managed to go into another decade of life. To take the births first, it is noted that, since 1891 there has been a considerable increase in children under 10 years of age the total number having increased from 639,077 in that year to 770,524 in 1901 and to 925,104 ten years later.

Proportion at each period to total population.

Age period	1911.	1901.	1891.
0—10	27.0	24.8	23.0
10—20	21.7	21.8	20.8
20—30	17.9	18.4	18.9
30—40	13.9	14.8	14.6
40—50	9.8	9.7	10.0
50—60	8.7	8.7	8.9
60 & over	4.8	4.2	4.8

Though the actual excess is thus larger at this than at the preceding Census—148,810, against 137,747—the ratio per cent. is less, being 10.1 as compared with 21.6 in 1901. This seems, at the first blush, to militate against the fact noticed above that in producing the large increase in population, births have had a greater share at this Census than in the previous one. But if the figures of an earlier decade are examined, it would become clear that children under 10 years in 1891 were then considerably under

estimated, that in 1901 the proportional growth therefore was more apparent than real and that, as compared with the growth of the previous decade that of the last one is distinctly greater. At the Census of 1881 as many as 643,069 persons were entered under ten years of age. As the aggregate population enumerated in 1881 was found to have increased in 1891 the rate of increase being the same at the two Censuses, and as, at the two succeeding enumerations, there has been a great advance in the total population as well as in children under ten, it is not expected that the Census of 1891 would be an exception. But it happened that there was not only no increase in children, but the number actually declined to the tune of 4,000 from that found in 1881. This resulted in the percentage variation between 1881 and 1891 being put on the side of decrease (— 6 per cent.) as noted in the abstract. Again such a decrease was not limited to persons under ten, but was spread over the next higher age-period of 10—20. When, however at the 1901 Census, the large increase in the total as well as in the younger population necessitated a close study of the explanation therefor it appeared that, in 1891 the earlier ages were to a great extent despoiled of their legitimate share without any warrant. The consequence was, that persons in the ages 0—10 and 10—20 seemed more numerous in 1881 and much more so in 1901 than in the intervening Census and that the 1891 enumeration, while presenting a decreased ratio as compared with the preceding one gave to that succeeding the appearance of a thumping increase. The entire subject of variation was discussed at length in Ch pters II 111 and IV of the Report on the 1901 Census and, in view to deduce a rate of growth allowable under the circum

stances of the decade concerned, an attempt was made to adjust the population of 1891 with regard to the deficiencies discovered. If, in such an adjustment, the age-period of 0—10 be given its due proportion, the recorded increase of 21.5 per cent at the 1901 Census would diminish to about 17 per cent, while the decrease of — 6 per cent in 1891 would stand converted into an increase. It is not necessary for the present discussion to set about excising the extra percentage from the decade 1891—1901 and restore it to the preceding period. Suffice it to merely note the underlying cause of an apparent anomaly, but for which the variation from Census to Census should have been one of steady progress, and to pass on to the further explanation that the very large addition to the number of children during the last decennium is what should ordinarily be expected from the marital condition gatherable from the returns.

Though the number of married females at the child-bearing ages is found to have increased during the last decade at a lesser ratio than in 1891—1901, their proportion to 1,000 of the sex at those ages, which stood at 766 in 1891, rose to 772 ten years later. If the re-productive ages of both the sexes are taken into account, the proportion to a hundred of the population is seen to have been 43 at the 1891 Census and 42 in 1901. The maintenance of these high ratios of married women has justified itself in the large increase of children at this Census, the proportion being greater than at the two previous ones. For every one-hundred married women at 15—40, there are now 171 children under ten years of age, against 162 and 153 in 1901 and 1891 respectively, while on a thousand of the population, they numbered 270 at this Census as compared with 263 and 249 respectively at the previous enumerations. To turn now to the higher ages, still greater increases are recorded,

Total population in 1901	3,052,157
Do in 1911 aged 10 and above	2,503,781
Percentage of decrease	15.2
Total population in 1891 as revised	2,640,523
Do in 1901 aged 10 and above	2,176,339
Percentage of decrease	17.6

pointing to the conclusion that there have been large survivals at those periods. That, during the decade under review, the hand of death has been slow, will be evident if the total population at each Census is taken up and compared with the balance carried over

at the following enumeration. The marginal summary, which institutes this comparison, shows that, so far as the 1911 Census is concerned, the percentage of decrease, or, in other words, the ratio of mortality, has been less by 2.4 per cent than what it was ten years earlier.

It is thus evident that the total population, as now enumerated, has been in a considerable measure maintained by a large proportion of the young as well as of those of riper years, the viability of the elderly population being noticeable in the strikingly high percentages of increase now registered as compared with those of a decade ago. In other words, the final result has been due to the combined action of higher birth-rate and reduced mortality.

Unfortunately, it is not possible to supplement the conclusion based on Census statistics, by information derived from other sources. No trust can be placed on the data furnished by the general vital statistics returns. They give a birth-rate of 17.8 per mille and a death-rate of 15.1, or an excess of only 2.7, or say, 3 per cent for the decade, against a Census increase of 16 per cent, though an indication of the population movement may be obtained from certain special returns of the nature mentioned in para 42 of this Chapter. It was stated therein that the twenty-seven places for which figures have been compiled for a period of three years contained a population of 111,483, and exhibited an annual average birth-rate of 36.7 and

a death rate of 26·9 per mille. The excess of births over deaths gives a natural increase per year of 9·8 or 10 per thousand of the inhabitants registered. But the rigid application of this rate to the growth of the population in the State as a whole implies the strict accuracy of two necessary assumptions. The one is that the condition of things in the localities observed is a reproduction in miniature of that which prevails in the State in all its parts. The other is that the three years in which the figures relate are quite typical of the decade not only as far as the places in question are concerned but also of the entire outside urban as well as rural. Neither of these assumptions can be expected to quadrate with the actual facts. However a side confirmation of the remarkable growth of population is all that can be hoped for from extraneous sources such as they are and this confirmation is amply provided by the returns taken up for comparison.

52. Since the year of the first regular Census when the pressure of population stood at 804 persons per square mile the State has added 148 persons on that area, and as much as 48·3 per cent to the total number of its then inhabitants. During the last twenty years, the density has been increased by 115 persons one-half of it in the first decade and the other half in the second.

The distribution of the population classified according to density was given in Table II appended to the first Chapter. It shows that about seven-tenths of the inhabitants are congregated on a third of the area carrying more than 600 persons to the square mile a seventh on the same proportional extent with a density of 300 to 600 persons, and the remaining one-seventh on a fourth of the area where there are only 300 persons and below. In other words, of the total population eleven twelfths occupy about three fifths of the whole area while the rest are scattered over the remaining one-fifth where the inhabitants do not count more than 150 on a square mile.

This statistical aspect of the subject of population naturally brings up the question of the continuance of the growth now disclosed in the densely peopled areas, and the extent of development that may be anticipated in the sparsely inhabited tracts. When variation since the 1901 Census is examined side by side with the density as then shewn, it is seen that the absolute growth of population has been greatest in taluks with a density of 750 to 900 persons. The next greatest increment is recorded for taluks with the highest specific population namely 1,000 and over then follow taluks with 450 to 600 persons and then those with 150 persons and under. The greatest proportional increases however have occurred in taluks bearing 600 to 750 persons on a square mile and in those of the lowest density while taluks which have returned the large actual increment come third in respect of proportional growth.

That in the present state of things, density of population is not one of the prominent factors that determine by an inverse ratio the growth of particular tracts is well borne out by the statistics just glanced at. "Overcrowding is a relative term. An exceptionally fertile tract will support with ease a far larger population than another less favourably situated. It is generally assumed that the tendency is for people to move from densely inhabited areas to others where there is more room. But this is not always the case. Where the population is sparse there is usually some good reason for it e.g. barrenness of the soil, an insufficient rainfall, inability to flood, or unsuitableness of climate. Past experience has shewn that the absolute and relative growth is often greatest in tracts where

the population is already fairly dense. Sometimes of course a tract is sparsely populated on account of political conditions only recently removed, and in such cases, *ceteris paribus*, a relatively rapid growth is to be expected. So also with tracts which have recently been provided with facilities for irrigation."

53 The marginal abstract particularises the growth of population in the British Indian Provinces and States, and in some countries of Europe and Asia, for which information is available. The variation in density during the inter-censal period concerned is also shown. In respect of proportional increase, Travancore in all India stands

PROVINCE, STATE OR COUNTRY	Percentage of variation in popula- tion	Absolute variation in density	PROVINCE, STATE OR COUNTRY	Percentage of variation in popula- tion	Absolute variation in density

The variations in population and in density given in columns 2 and 3 respectively refer to the intercensal period shown in column 1.

in the advancement of population or in the increase of its pressure, holds out prominently in the Census hierarchy.

second only to Hyderabad with 20 per cent and marches on all fours with the Central Provinces and Berar. In respect of the addition to the specific population too, this State holds the second rank, Cochin taking an easy first, and Hyderabad going down as the third in the list. Of the eight countries outside India taken up for comparison, every one of them shows a lesser rate of annual increase, though in regard to density three of them have added a greater number per square mile.

Thus then, Travancore, whether

54 And now a few words in conclusion. Travancore is a distinct political organism in itself and has to work out its own salvation.

Conclusion.

"The true greatness of a State", in the words of Bacon, "consisteth essentially in population and breed of men". The importance of the subject of population, therefore, cannot be overestimated, whether viewed from the point of numerical growth or from that of the character of the progress and civilization reached or aimed at.

To the reputed profligacy of the Indian, the Travancorean is no exception, provided no opposing forces are at work. Religious injunction and social sanction alike operate towards the multiplication of the people. Prudential restraints are not generally so strong as to counteract the desire to multiply. Here, a word may be interposed in regard to "nuptiality" or the tendency to marry. In European countries the marriage rate was once regarded as the barometer of prosperity*. Though this test is no longer considered as trustworthy, "the main thesis is still, no doubt, generally true, that wherever there is room for two to live together up to the conventional standard of comfort, a marriage takes place". Here, in India, marriage is usually governed by other circumstances. Where married life is viewed as the normal state of man and where, among the majority of the population, such a life is enjoined as a religious duty, the considerations which influence the acceleration or retardation of marriages in the

* In his Elements of Vital Statistics, Dr Arthur Newshome observes — "We find that the marriages of England increase as the result of peace after war, abundance after dearth, high wages after want of employment, speculation after languid enterprise, confidence after distrust, national triumphs after national disasters. He adds that 'the same conclusion is borne out by the fact, frequently alluded to by the Registrar General in his reports, that the marriage rate varies in the same direction as the value of British exports, the average price of wheat and the amount per head of population cleared out at the Banker's clearing house. The coincidence, it should be pointed out, is one in direction, but not in degree.' Page 59-60.

West do not enter. The effect of prosperity or otherwise upon the population comes in for notice, not as a determining condition before marriage but as a force influencing the married couple and its progeny later on. To put the whole thing briefly in the West they marry when they get, or are assured of the means of support. Here, they marry and the means of support does not weigh in the question. Its practical importance will be apparent when it is remarked that, with this deep-rooted tendency efforts have to be directed only towards the married being enabled to provide themselves with the means of subsistence and to rear a healthy offspring. While in some countries of the West such as France encouragement has to be extended for people to *get married* here endeavour has to be directed towards helping them to *live married*. In such a state of society the ultimate check to the increase of population is the deficiency of the means of subsistence. Now this question of the means of subsistence it is needless to remark, cannot be considered except from the aspect of the condition and structure of the society concerned. It is equally obvious that the most effective solution for increasing those means is by methods which would not go against that structure but would help in stabilising it. So far as Travancore is concerned, the old world edifice of hereditary labour has not yet completely crumbled and become obsolete. The ryot is shrewd and industrious. The artisan has skilled hands and a resourceful heart. The climatic conditions, though not the best, are certainly not inconsistent with the formation of a good physique. If then, there be no extraneous conditions to disturb the pursuits of life and if the producing classes referred to are kept encouraged and stimulated in their production by the requisite measure of tributary and protective service at the hands of what may be called, by contradistinction the consuming classes, as a matter of self interest as much as of duty there is no reason why the population of Travancore should not grow apace. If the progress disclosed during the past two or three decades—a period during which several forces have come into being—is of value it may be said that as regards the development of populational strength, the future is full of hope. In the Western Natural Division there are no doubt, localities where the pressure of population may seem to be approaching a limit but there is no reason why room could not be provided for a much greater number than it now accommodates, if sentence is called in to aid agriculture and enterprise steps in to create and foster industries and develop trade and commerce to which the Division is specially suited. On the other hand, in the Eastern Natural Division there are still large tracts available for the population to expand. The rains come the year round and benefit the characteristic cultivation whenever and wherever they fall. The extensive areas now barren and uncultivated can be rendered fit for cultivation. These tracts were once well peopled and the seats of sovereignty and it is possible that well adapted schemes of irrigation in certain places and of drainage in others may restore to them their lost fertility and population. It does not, therefore appear impossible for the Eastern Division to well maintain a population, at least half as dense as if not more than, that of the Western Division. If such a happy state of affairs should come to pass, the inhabitant of that Division would by themselves approach in strength the present total population of the State.

Thus the agricultural aspect so far as it bears on the growth of population has been touched upon. There remains for notice the industrial side which is all important in a country like Travancore where raw materials for ever so many industries are available. Only a few general remarks will be here attempted, a detailed notice of the subject being reserved for the Chapter on Occupation.

chief ingredients of the world's progress, would really end in making the world unfit for human abode. But whatever the effects on the advanced races, the substitution of machine labour except under great safe-guards and restraints must to nations less advanced in the scale of modern civilization, spell ruin. For a people whose powers of production and wide distribution of goods in advance of demand are very small either owing to want of skill or of money and whose sense of responsibility towards social interests is little more than naught independent hand labour is decidedly better. Under it even poor people will have the chance of living freely and without dependence and the country need not wait for capitalists to set up machine labour to work under. Machine labour is of course not contraband. Only it should be raised on an assured foundation of general industrial well-being—a condition which the immediate abolition of existing labour however caused or justified, cannot help to bring about. The final determination of the industrial policy of the country and of the methods by which it is to be worked about is, therefore a matter of extreme urgency and if the question be taken up on the lines above foreshadowed, it is not too much to hope that a way to the growth and maintenance of a healthy and happy population shall open.

SUBSIDIARY TABLE I—*Variation in relation to density since 1875*

DIVISIONS AND TALUKS	PERCENTAGE OF VARIATION INCREASE (+) DECREASE (-)				Net variation 1875 to 1911	MEAN DENSITY PER SQUARE MILE

NOTE

ON

VITAL STATISTICS

1 It is now about fifteen years since births and deaths began to be recorded throughout the State. The system of registration, the scope of its legal basis, the machinery employed, &c, were fully described in the Note appended to Chapter II of the 1901 Census Report. The information given below brings that record up-to-date.

2 *Basis of the system* —There has been no change since the last Census (1901) in the system of collection and registration of vital statistics in the municipal towns till December 1909, when Regulation III of 1906 (which repealed the Regulation II of 1909) was amended by Regulation V of 1905, so as to make the persons defined in the Regulation responsible for giving information of births and deaths on their own accord. The sections of the Regulation now in force relating to registration are subjoined for reference and easy comparison with those published in the Report on the Census of 1901.

Sections in the Towns Conservancy and Improvement Regulation, III of 1906, as amended by Regulation V of 1905, relating to the registration of Vital Statistics

109 (1) The Committee shall keep in their office a register of all births and deaths in the town according to the forms which may be prescribed for the purpose by Our Dewan.

(2) They shall, with the previous sanction of Our Dewan, appoint a person to be Registrar of Births and Deaths.

110 The Registrar shall inform himself carefully of every birth and death which happens in the town and shall register, as soon as conveniently may be after the event, without fee or reward, the particulars required to be registered according to the forms prescribed, touching every such birth and death as the case may be, which has not been already registered.

111 [The father, karnavan or mother of every child born in the town, or in the case of the death, illness, absence or inability of the father, karnavan and mother some person who was present at, or in attendance during, the child-birth, shall within one week next after the day of every such birth, give, or cause to be given information to the Registrar, according to the best of his or her knowledge and belief, of the several particulars required to be known and registered touching the birth of such child.] (i)

112 [Some one of the persons present at the death, or in attendance during the last illness, of every person dying in the town, or, in case of the death, illness, inability or default of all such persons, the occupier of the building, or, if the occupier be the person who has died, some person living in the building in which such death has happened, shall, within three days, give information to the Registrar, according to the best of his knowledge and belief, of the several particulars required to be known and registered touching the death of such person, except in the case of deaths from infectious diseases, when notice should be given within 24 hours.] (b)

113 Every person who conducts or performs the funeral ceremonies of any person who has died within the town shall, whenever required, furnish to the Registrar such information as he possesses as to the several particulars.

114 In the case of persons born or dying in any hospital, it shall be the duty of the Medical Officer in charge forthwith to give intimation in writing to the Committee, of the occurrence of any birth or death in the hospital under his charge; such intimation shall be in the forms aforesaid.

115, If any person whose duty it is to give information of births and deaths under the preceding sections, wilfully neglects or refuses to give such information or gives false information, he shall be liable to a fine not exceeding twenty rupees.

(a) Substituted by Section 12 of Regulation V of 1905
(b) Do Do, 18 Do, Do,

In rural areas, the vital statistics administration has no legal basis, but is conducted under the executive orders of the Government by their own servants.

3 *Machinery*—In municipal towns special Registrars are appointed.

In such of the places declared to be "towns" under the Police Regulation, IV of 1900 M. E. as have been provided with conservancy arrangements under the Sanitary Department of the State the Overseers in charge of the conservancy staff in those towns have been made responsible since 1906-07 for the collection and registration of vital statistics within the limits of the said towns.

In rural areas, after the abolition of the viruthi system the Proverticars whose number has been increased by the appointment of a Proverticar for each *panathu* have been entrusted with the vital statistics work.

For the Forest tracts estates, etc., the Forest officers Planters, etc. continue to do the work.

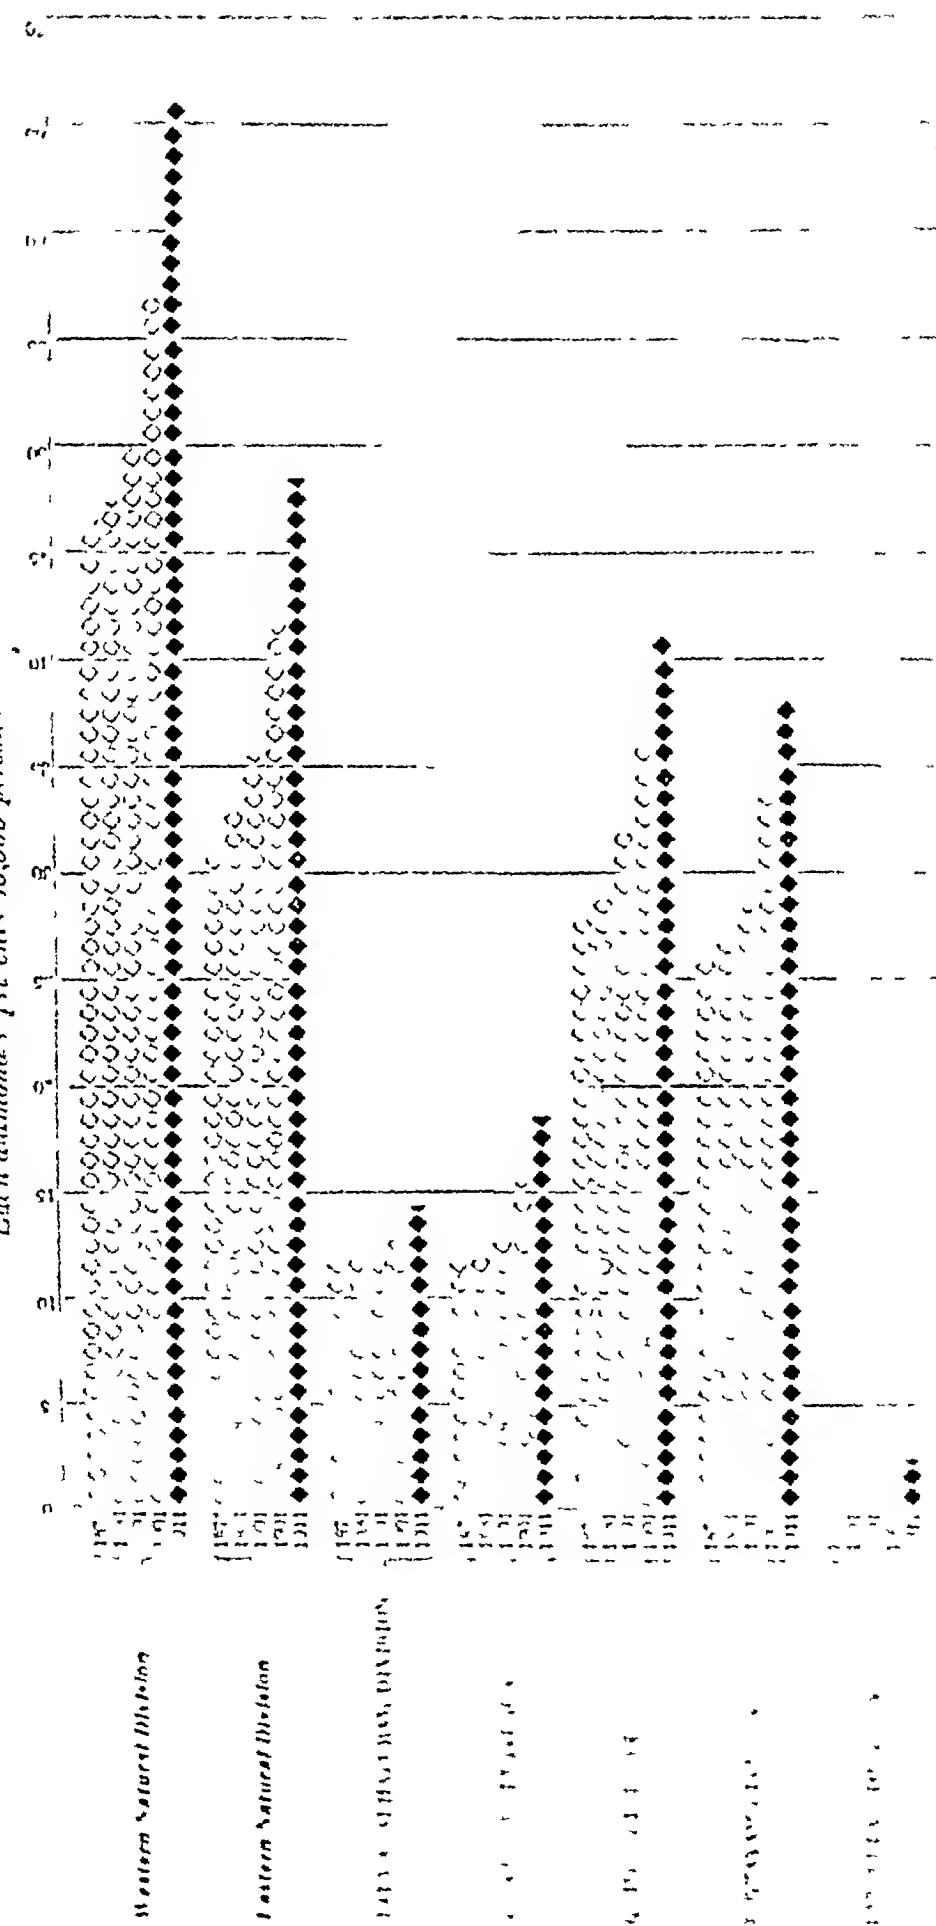

4 *Qualification and caste of agency*—The Registrars in municipal towns the Conservancy Overseers in police towns and the Proverticars, &c., in rural areas are all literate. Each of them is supplied with a copy of the Manual for the Birth and Death Registrar in use in the Madras Presidency to assist him in finding out the correct classification in case of deaths. The Proverticars are generally *vaiyars*.

5 *Checking of returns*—In regard to checking periodical inspection by the officers of the Sanitary Department is superadded to the local scrutiny of the Revenue Department or Estate authorities as the case may be.

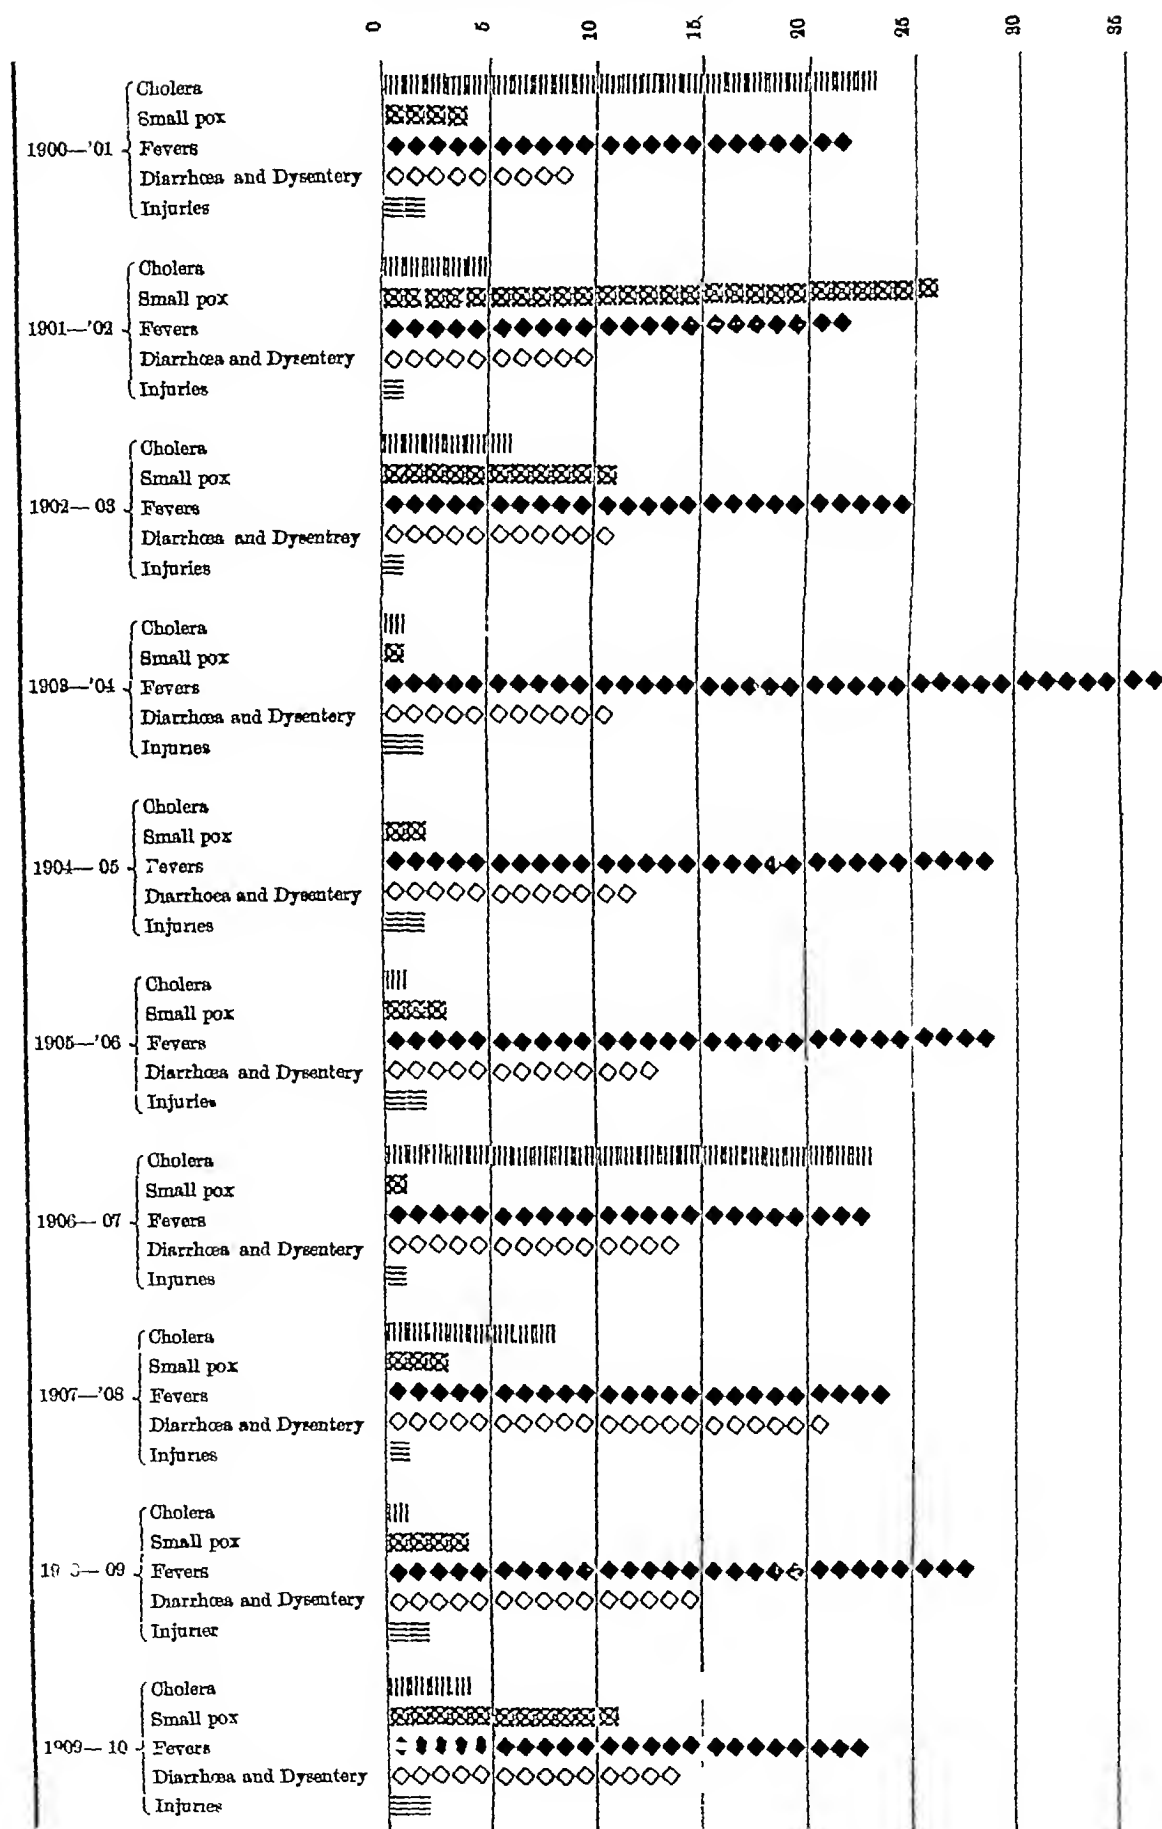

6 *Particulars published*—The returns as published for the last several years give only the total number of births and deaths in each taluk without distinguishing the sexes. Again, they do not record the months in which, and the classes of the population among whom they occur nor the ages at death. In regard to the causes of mortality the figures under each death-cause are lumped together for the whole State and are not shown by administrative units. These defects are well worth remedying.

7 *Birth and Death rates*—The general figures for births and death for the whole State give the rates as 17.6 and 14.8 respectively per mille which the Sanitary Commissioner observes, are only half of those of the Madras Presidency and are seen to be even lower than the low rates recorded in the 1901 Census Report, namely 19.3 and 15.4 per mille respectively. Inaccuracy of the vital statistics has been a subject of unceasing comment in Indian Census Reports. That it takes long for the Department concerned to reach its full development may be gathered from the observations made by the Madras Superintendent in the 1901 Census Report, with a record of 3 years' administration at his elbow. He remarked that registration was "so incomplete that the statistics returned are worthless in all matters in which exactness is required" and that "both the birth and death rates are impossibly low." It is not known how things are there now. Very probably the last decade has shown some improvement. However the remarks are quoted, not to serve as a comforter but to illustrate the difficulties that beset the attempt elsewhere. It is all the more so here in view of the handicaps to registration in detached rural homesteads, the evident desire to do things without undue hustling of the people and the condition of the reporting agency. It is not worth the while therefore to examine in detail the figures returned and draw from them any very extended inferences.

Diagram showing the population of each Division at the Censuses of 1875, 1881, 1891, 1901 and 1911.

**Diagram Showing the percentage of deaths from various causes
for period 1900—'01 to 1909—'10**

CHAPTER III.

BIRTH-PLACE

(TABLE XI),

55 Imperial Table XI embodies the statistics of birth-place for the population enumerated in the State as a whole and in its component Divisions. The corresponding Table in the Provincial Volume distributes the population in each taluk according to the place of origin. At the end of the Chapter are given the following Subsidiary Tables, which summarise the absolute figures and present them in proportional form

Reference to
statistics

Subsidiary Table I.—Showing the actual amount of immigration to each Division

Subsidiary Table II.—Showing the actual amount of emigration from each Division

Subsidiary Table III.—Containing the proportional figures of the migration to, and from, each Division

Subsidiary Table IV.—Comparing the volume of migration between Natural Divisions at this Census, with that in 1901

Subsidiary Table V.—Showing the gain or loss by migration between Travancore and other parts of India

A diagram is appended, which shows for each taluk the ratio of immigrants and of emigrants to 10,000 of its population. The migration to, and from, the two Natural Divisions is also compared in this diagram

56 Migration, in so far as it has affected the variation in population, has been dealt with in the preceding Chapter. The immigrants were separated from, and the emigrants restored to, the home-born, and the natural growth of the indigenous population thereby ascertained and recorded. For that purpose, it was needless to consider where the foreign-born first saw the light of day, and whither the home-born had strayed. This will be done in the present Chapter

General remarks

The scope of the subject, as thus limited, does not admit of lengthened discussion. The people are generally found confined to their homes and their immediate neighbourhood, and migration, as has been already seen, plays no perceptible part in the composition of the population. The reason generally assigned is the undue fondness of the people for their places of birth, flowing not from the tenacity of higher patriotism but from the unyielding conditions of social cohesiveness making for national inefficiency, to which, it is said, the Indian, particularly the caste-man, is wedded. "The Hindu, in particular, when he leaves his permanent home, suffers from many disadvantages; he is cut off from his old social group, with the members of which he could eat, smoke and intermarry, and

he finds it very difficult to enter a new one. It is therefore very seldom that he permanently severs his connection with his birth-place, and although he may go abroad in search of a better livelihood than he can get in his own country his exile is as a rule, only temporary. He endeavours to return home from time to time and he cherishes the hope of eventually resuming his residence there. The Muhammadan is not so circumscribed by caste prejudices, but in practice he is found to be almost equally reluctant to go very far from his ancestral home. To the list may be added the Christians, who form a substantial portion of the population. The diagnosis, however contained in this extract, while it rightly lays great emphasis on the exceeding love of the people for their homes and on the strength of the domestic affections, gives too much prominence to the social impediments, and pushes to the back-ground the true reason—which is the simplest as well and in fact is responsible for the development of the strong tie to home and country referred to, viz want of the need to go. In European countries colonization is one of the prime factors in developing the tendency to migrate, and colonization is permanent migration in large numbers as an organized national system. Of course, even if migration has to be resorted to as a temporary measure of earning a livelihood, it may lead in most cases to permanent settlement. But this forcing out movement is only developing in India, the population taken as a whole not having yet over-stepped the limitations of present food-supply. Not only is the need and the benefit of going out not keenly felt, but the facilities to go or settle permanently hardly exist in the required measure. Old nature's law of restriction in time and space appears to operate more or less, confining the placid Indian to his appointed land and labour such as they may be. The world is all before them where to choose is not the motto recognised †. But where under modern conditions of over-proliferation of population and un-employment as in some cases and industrial displacements and dis-employment as in others, the necessity for stretching out has begun to assert itself migration is resorted to. But it is yet only of a temporary kind. Even this necessity to go abroad, however does not seem to have arisen in any degree in Travancore. There is ample scope in His Highness's territories for even a larger population and it is seen that the people are gradually spreading over the land. In fact, if the spirit of expansion within the country or home colonization as it may be called, now going on quietly and steadily be perturbed in and encouraged, Travancore can afford space and the wherewithal to live for the progeny of its present population, multiply though it may several fold.

67 Five different kinds of migration are generally distinguished. These and the extent to which they are applicable to this country are explained below.

(1) *Casual*.—Under this head are classed all movements occasioned by the practice of taking wives from outside the village and of women going to their parents' home for the first one or two confinements. It is only when the villages in question lie on opposite sides of the boundary separating one taluk or Division from another that these casual movements appear in the returns. On an analysis

India Census Report, 1901—p. 86.

Is it not probable, says Mr. in "The Christian World" that the phenomenon of emigration may have been a part of an unrecognized religious impulse, a secondary expression of the yearning for the larger, more abundant life? But at least, we know in truth that not in earth, not in sky, not in sea, is there space enough to satisfy the space-hunger of the human soul. When we have exhausted the last acre of waste prairie, when the last mining claim in the world has been staked out, when the last estimate problem of air navigation has yielded its solution to the airman and he awaits the dawn of the day which will allow him to be his lord, is it likely that we shall be at rest? We shall perhaps not come to be lords of the planets, but even though we accepted the solar system as our kingdom, we should be persecuted.

of the sexes of the immigrants in every taluk and Division, it is seen that females invariably preponderate, which is the case in all migrations of the casual kind. It may be added that this practice of going beyond the village or its neighbourhood for the selection of a bridegroom or bride is getting gradually widened, and is strongly fostered by the greater facilities for communication and the acquaintance that is growing up among the people living in distant parts. Travancore shares no doubt in the social character of these migrations, but its volume is limited. While the Tamils do not appear to be recruited for their women-folk from far beyond the outlying districts of the Presidency, the Malayalam population has not to go farther than the west coast or their own portion of it.

(2) *Temporary*—This occurs when there is a demand for labour in any place due to the carrying out of projects, the construction of new roads or railways and in the case of journeys on business or visits to places of pilgrimage. The latter migration cannot appreciably influence the statistics, unless the Census date coincides with the times of great crowding on account of special occasions—a coincidence which it is usual to avoid as far as possible. In regard to the former class of temporary migration, the Quilon-Shencottah railway in the Quilon Division and the Kodayār Project works in the Padmanabhapuram Division once drew labourers from far and near. Now that they are completed, labourers are necessary only in connection with the cutting of the channels. There is again the planting division of Devikulam, which needs a large contingent of workmen. But this is not new to the present Census. What has to be noted, therefore, is the variation in the volume during the decade, and will be referred to in due course.

(3) *Periodic*—The annual migration which takes place in different tracts at harvest time, &c., is generally brought under this class. Agricultural labourers employed in removing the crops do stretch out over large areas, but their numbers in Travancore are small. The necessity for large movements is not felt anywhere, as the supply from the locality and the immediate neighbourhood usually suffices. Workmen, however, congregate and are engaged in some of the northern midland taluks in connection with reclamations for agricultural purposes. It may also be mentioned here, that people engaged in the toddy-drawing occupation in the southern taluks of the State migrate to the villages beyond the borders of Travancore for work at about the period of the Census.

(4) *Semi-permanent*—This comprises cases where the inhabitants of one place earn their livelihood in another, but retain connection with their old homes, where frequently they leave their families and to which they repair at intervals and eventually retire. Some of the now naturalized industrial and trading classes such as Patnulkars, Musalmans, Konkans, &c., once belonged to this category. This tendency for the semi-permanent migrations to become permanent is, it may be remarked, growing.

(5) *Permanent*—The gradual flow of population to the interior tracts from the congested sea-board is an instance of this class of migration within the State.

As already remarked, the birth-places recorded at the Census do not furnish any reliable clue to the character and volume of all the different kinds of migration noticed above. The test suggested for ascertaining to which class a migration belongs is the proportion of the sexes. In casual migration, it has been observed already that females are in excess of males, while in the other types males predominate, except in permanent migrations where the sexes approach equality.

There is one more point to be mentioned in connection with the migration returns. When the boundaries of administrative units are changed between one Census and another the returns, which only record the actual birth-places, will show that a greater number of immigrants have come from a neighbouring taluk or Division, when really there was no migration at all. There have been such changes in boundaries in regard to thirteen taluks during the last decade but as the volume of migration itself is generally small they may be left out of account.

58. Of the entire population 81,105 are immigrants from outside the limits of the State. 8,867,810 persons, or as many as 9,822 in every ten thousand, have returned themselves as born within Travancore—3,329,790 persons being enumerated within the Administrative Divisions in which they were born, and 38,020 in contiguous Divisions and other parts of the State.

Diagram showing proportion of immigrants.

—The base of each rectangle indicates the actual number of immigrants and the height, the proportion coming from each locality.

from outside India, there is a decline at this Census, the number having gone down by 172 or 23·7 per cent.

59. (1) *Immigrants*.—The population immigrant from within the geographical limits of India is composed of 50,112 persons or 82·7 per cent. from British territories, 10,351 or 17·1 per cent. from the other indigenous States and Agencies, and 160 or ·2 per cent. from the French and Portuguese settlements. The Madras Presidency with the States in political correspondence with it, almost monopolises the entire British Indian supply the former contributing as many as 49,511 persons or 81·7 per cent. on the number from all India, and Cochin 9,946 or 16·4 per cent. All the Districts of

alone and other parts of the State the total ratio resolving itself into 9,711 and 111 respectively. The figures for the two Natural Divisions show that, of the 9,822 home-born per ten thousand of the population 9,660 belonged to the Divisions in which they were found the remaining 162 having passed over from the limits of their own Division into the other.

Of the 81,105 immigrants, 49,401 persons have come from Cochin and the neighbouring Districts of the Madras Presidency 11,110 from the non-contiguous Districts and the other Provinces and States, and the remainder from beyond India, the proportions under these heads on 10,000 of the total population being 144·82 and 2 respectively. Since 1901 the number of immigrants has increased by 11·4 per cent., though the percentage to the enumerated population shows a slight decrease from 1·9 to 1·8. Under the head of immigrants from outside India, there is a decline at this Census, the number having gone

the Presidency without exception claim a share, though in varying degrees, the incomers diminishing as the land of birth recedes farther away from this State. Of the three adjoining Districts, Tinnevely has sent in 31,936 persons, Madurai 4,568 and Coimbatore 2,982. Malabar and South Canara are the only non-contiguous districts from where the immigrants number 1,000 and over, the actual figures being 3,216 and 1,670 respectively. From beyond the Presidency, the arrivals are very few, the highest numbers from the Provinces being 171 (Bombay) and 123 (Bengal), and from the States, 281 (Mysore) and 67 (Hyderabad).

(2) *Emigrants*—In regard to the emigration of Travancoreans, there is not much to speak of. The returns given in the margin, though much fuller

Emigrants from Travancore

PROVINCE OR STATE	Persons	Males	Females
* Baluchistan	5	3	2
Bengal	65	45	20
Bombay	135	103	32
Burma	124	76	48
Central Provinces and Berar	18	11	7

Cochin	15,207	6,023	8,285
* Hyderabad	6	2	4
Mysore	182	115	67
Total	26,218	18,471	12,747

than at the preceding Census, cannot be said to be quite exhaustive. They show, however, that the total number of persons enumerated outside the State, so far as it is known, has risen from 24,490 to 26,218 or by 7 per cent. As usual, the Cochin State and the border Districts of the Madras Presidency draw out the largest numbers, and migration to these is more or less of the casual kind. The great complexity of territory as between Travancore and Cochin adds by contiguity its share to the large result, and the figures of migration in respect of Cochin need not bear any special economic import. But in regard to emigrants to Mysore, Burma and other distant places, the causes of their exodus can, in the absence of occupational details in the returns

be only surmised.

60 The statistics for the Administrative Divisions are particularised in the margin. Migration has resulted in loss to every Division except Devikulam. The Quilon Division received, as well as parted with, the largest number, but the net result has been a loss, as many as 2,813 persons having left the Division without others coming in to take their places. The movement

Intra-provincial migration.

DIVISION	MIGRATION BETWEEN THE DIVISION AND OTHER PARTS OF THE STATE.	
	Immigrants	Emigrants
Padmanabhapuram	4,701	5,793
Trivandrum	9,191	9,622
Quilon	9,355	13,169
Kottayam	8,125	10,893
Devikulam	6,647	33

has all been busy towards the east, and this fact becomes clear when the figures for the Natural Divisions are examined. As many as 39,240 persons who were born in the Western Division were enumerated in the Eastern, against 16,386 persons belonging to the latter Division and censused in the former. The proportion of the immigrants on the respective total populations of the two Divisions are, 8 per mille in the Western

Division and 27 per mille in the Eastern. Since the Census of 1901, the number of immigrants from the littoral area has gone up by 8,765 or 28.8 per cent, while the corresponding increase in the numbers from the interior tracts has been only 2,330 or 16.6 per cent.

* Since the second Chapter was written, emigration returns were received from these Provinces and States. These figures have been added to the number given in para 51 of that Chapter and the final total is entered in this abstract. The excess, however, is small and does not affect the conclusion arrived at, in regard to the influence of migration on the movement of population.

Diagram Showing the proportion of Immigrants and Emigrants to 10,000 of the total Population.

CHAPTER IV.

AGE

(TABLES.)

61 The age statistics of the population are embodied in a series of Imperial Tables—VII, VIII, XII, XIV—where they are shown combined with religion, civil condition, education, infirmities, certain selected castes. There will be taken up in separate Chapters, later on. Here, the subject of age will be discussed in general, and the figures examined to see how far they throw light on the fecundity and longevity of the population. The variation in the age distribution since the Census of 1901 will also be noticed.

The following Subsidary Tables relate to the main features of age statistics—

Subsidary Table I—A—Showing the unadjusted age return of 100,000 of each sex for the two main religions—Hindus and Christians.

B—Showing the age distribution of the entire population under each sex by annual periods.

Subsidary Table II—Showing the age distribution of 10,000 of each sex in the State and in each Natural Division.

Subsidary Table III—Showing the age distribution of 10,000 of each sex among the Hindus and the Christians.

Subsidary Table IV—Showing the age distribution of 1,000 of each sex in certain castes.

Subsidary Table V—Giving the proportion of children under ten and of persons aged 60 and over to those aged 15—40, also of married females aged 15—40 per 100 females.

Subsidary Table VI—Showing the variation in population at certain age periods in the last two decades.

Subsidary Table VII—Embodying the reported birth rate by sex and Natural Divisions.

Subsidary Table VIII—Showing the reported death-rate by sex and Natural Divisions.

62 The ages, as recorded, disclose certain marked peculiarities which appear, however, to be more or less common to all Censuses. The diagram on the next page shows the actual ages of the entire male population. It will be seen therefrom that children five years old are more numerous than those at any of the ages below five, and that persons at the ages 10, 25, 30, 35 and 40 out-number those living at the age of 5. But, where a population is progressive or even stationary, the number at each age should ordinarily decrease from year to year. The explanation for the return showing the contrary is generally taken to be the tendency of the people to return their ages in multiples of 5. If the ages below 5 are examined, it is seen that the age of 3 has the highest number, with the ages 2, 4, 0 and 1 coming thereafter in successive order. In respect of persons above 5, the virtue of attracting contiguous

Diagram showing the distribution of the male population by annual age periods.

Note.—The figures at the bottom indicate the age and those at the side the number of persons concerned, &c.

younger than she really is. In regard to the old too the ages are often exaggerated, the exaggeration being more marked in the case of females. Inaccuracy in age-return resulting from causes of this kind are not peculiar to the census of Travancore or for that matter to Indian censuses. Dr Arthur Newholme in speaking of errors in Census data, gives considerable prominence to the ignorance of adults as to their precise age the untrustworthiness of the ages of young children and wilful misstatement of age more especially among women. There is, he observes, "a great tendency to return ages as some exact multiple of ten when really a year or two on one side or other of the precise figure (30, 40 50 &c.)"

Among children under 5 years of age the vagueness with which parents use the terms one year old, "two years old, &c. when the children are only in their first or second year respectively is a cause of considerable error. At every Census, the young women of 20 to 23 years of age have invariably been more numerous than were the girls aged 10 to 15 at the immediately preceding Census. That these sources of error are over operative will be seen from a perusal of the Section relating to Age in the 1901 Census Report of England and Wales, which is the latest to hand.

Several methods have been suggested for remedying the inaccuracies in age-statement. One of them refers to what is known as "Bloxam's method." It is applied to the ages abstracted by single years and has been described in the last Census Report. In this method, only such eccentricities as result from the heaping up at certain round numbers are cured. The effects of all deliberate misstatements remain untouched. But, as it enables comparison of

numbers for the purposes of record seems to reside in the ages of 8, 12, 14 16 18, 22, 28, 32, 38, &c. Apart from this tendency to plump on certain favourite numbers there seems to be another misleading factor. Males during the middle periods of life it is said, understate their ages, and this proneness comes even earlier in regard to females. While females at the ages 0—5 outnumber the males, the position is reversed in the next five-year period. It is said that once a woman is married, her age is often exaggerated while she is still very young but the estimate then remains unchanged so long as she is capable of child bearing and until this period of life has passed so is often shown as much

Suppose that the series show irregularities, the period of the largest of which is either $2n$ or $2n + 1$ where n is an integer so that $2n + 1$ necessarily represents an odd number. Then, in order to do away with these irregularities over the whole of the period and hence practically to eliminate them, the second or fourth or also k any term (say the 25 th term) is taken by itself the preceding and succeeding terms to the 25 th term, making in all $2n + 1$ terms to be averaged, and k is the result by $2n + 1$. The formula for calculation is of the form

$$\frac{1 + 2 + 3 + 4 + \dots + k}{2n + 1} \text{ terms}$$

If, proceed, regularly through the series, we obtain a series of averaged or smoothed values of the terms from which the irregularities of the period in question are practically removed. —(Travancore Census Report 1901—Page 189)

figures as between different enumerations and among the different religionists, the method has its uses to the extent of its application

63 From what has been remarked above, it may appear that no accurate results of far-reaching importance can be encompassed by a detailed examination of the age-return. But as the errors, whatever they are, may be assumed to be constant as between one Census and another, the returns would well admit of being used for gauging the relative age-distribution at the two enumerations and comparing the results deducible therefrom. Further, the discrepancies due to under-statement of age on the one hand and exaggeration on the other, invariably tend to neutralize each other, and leave the general features in the returns almost unaltered. Again, as the ages are grouped in five-year periods, the law of large numbers asserts itself, and inaccuracies do not tell to any appreciable extent. And finally, the Census is now the only source of record of the life-history of the population, and it is well to take advantage of it to the full extent and to note the conclusions that may be come to. In these circumstances, the broad features of the statistics may be briefly noticed with advantage.

64 To examine and compare the increase or decrease in the population at the different ages, five age-periods are taken, namely, 0—10, 10—15, 15—40, 40—60, and 60 and over. From the percentages of variation at the several periods treated in Subsidiary Table VI, it is seen that there has been, at this Census, an increase throughout in the numbers returned. In the ages 0—10, 10—15, and 60 and over, the ratio of increase has been over 19 per cent, and is greater than the rate of growth of the entire population, by 3 per cent. As regards the intervening periods, 15—40 and 40—60, however, the advance has been less than the general rate, being only 13.6 per cent in the former and 14.6 per cent in the latter. When compared with the 1901 enumeration, the rates of growth in the two highest groups, 40—60 and 60 and over, stand out very prominently, being 14.6 and 19.8 per cent respectively now, against 9.3 and 0.4 per cent, respectively during the previous decade. In the younger ages, the proportional increases are no doubt seen to be less now than what they were ten years ago by about two per cent, but it has been shown in the second Chapter that the swell of 21.5 per cent in children under ten, which the 1901 Census revealed, over and above the corresponding figure for 1891, was apparent and not real. The reduction in the rate of advance among children need not, therefore, be taken to indicate any adverse circumstance, such as a higher degree of mortality during the last decade. On the contrary, the fall in the death-rate appears to be a characteristic feature of the decennium that has just closed, especially at the two extremes of life.

The age-statistics of the Administrative Divisions work out these features in detail. In all the Divisions except Padmanabhapuram, the ratios of growth at the ages 0—10 and 10—15 exceed not only the normal rate of increase in the total population of the respective Divisions, but also the proportional increases at the previous Census for the same periods. In regard to the ages, 60 and over, all the Divisions except Quilon show large increases which, in regard to Padmanabhapuram and Kottayam, are higher than the average rate of population growth by 17.6 per cent, and 5.9 per cent respectively. In the intervening age-groups too, *viz.*, 15—40 and 40—60, all the Divisions show large additions in respect of the latter age-period, and the proportional advance is more marked. These features serve to illustrate the comparatively greater fecundity and longevity

of the population during the last decennium, to which reference has already been made

63. The mean age of the population, calculated on the numbers returned

under the quinquennial periods shown in Imperial Table VII entered in Subsidiary Table II and compared with the corresponding figures of the three previous Censuses. The annual ages tabulated and given in Subsidiary

Diagram showing the distribution of the corrected age periods of the total population of each sex.

Table I B have been smoothed for irregularities according to Bloxam's method, and the mean age worked out on the figures obtained at the final smoothing is shown in that Table. The diagram in the margin illustrates the distribution of the total population by age according to the smoothed results. It is seen therefrom that the eccentricities in the actual record have almost wholly vanished. It is further noticed that the mean age for either sex based on the adjusted figures dif-

fers but slightly from the result otherwise arrived at. For all purposes of discussion and comparison, therefore, the mean age entered in Subsidiary Table II is adopted.

In considering the subject of mean age it has to be borne in mind that the term merely signifies the mean age of the living; i. e. of the persons enumerated, and need not correspond with the mean duration of life or the expectation of life at birth. The mean age of a people is mainly a question of the relation between the rates of birth and of mortality obtaining among them. "In a growing population with a large proportion of children, the mean age of the living will be less than in a decadent one where the children are few in number even though there is no difference in the average longevity of the individuals who compose the two communities. A low mean age may mean either that the population is very prolific and contains a large proportion of children or that the adults die at a comparatively early age, while a high one may connote either a relatively long span of life or else a very low birth-rate or a high infantile mortality."

66. Since the Census of 1901 the mean age of the living in the State as a

whole has fallen slightly in the case of males i. e., from 24.6

to 24.4 years and continued at 23.0 as regards the other sex. As compared with the last two decades, when the people grew rapidly and the proportion of children rose the mean age shows a decline which, in view of the large advance in numbers, would have been greater but for the lessened mortality of the population at the riper years of life. There were at the last Census 2,648 children under ten years of age in every 10,000 males, and 2,749 children per 10,000 females as against 2,508 and 2,707 respectively in 1901. If the proportion of children male and female, is compared with persons between the ages 15—40, it is seen that for every one hundred of the latter there are now 65 of the former as against 60 at

The total number of persons living at the end of each age-period is ascertained and the mean of these totals given a number of years lived by the aggregate population. This mean is then multiplied by 5 the duration of the age-period and added by two and a half to the total number of persons dealt with. The result which gives the number of years lived, when divided by the number of persons living, yields the mean age of the population.

the previous Census. As regards persons at the ages 60 and above, their ratio to those at the reproductive ages has continued unaltered since the 1901 enumeration.

Taking the mean age of the population in the Natural Divisions, we find that, in the Western Division, it exceeds that in the Eastern by about two months in the case of males, and by about four months in respect of females. As the population is moving forward in both the Divisions at much the same rate, the comparatively longer span of life of the inhabitants in the former Division may be taken to explain the difference discernible in the mean age.

Of the two main religionists, Hindus and Christians, the former show the higher mean age for either sex. The figures relating to their relative fecundity and longevity, on which the mean age depends, may be looked into. Among the Christians, there are 2,761 males and 2,962 females under the age of ten in a ten thousand of either sex, against 2,590 and 2,617 respectively among the Hindus. In regard to the ratio of persons 60 years old and over, the Hindus stand in a better position, returning 126 males and 493 females per 10,000 of each sex, as against 388 males and 391 females respectively in a like number among the Christians. These ratios are calculated with reference to the total population in each religion, children included, and in view of the proportionately large number of the latter among the Christians, it may be inferred that the smaller ratio at the higher ages is but the arithmetical reflex of the overflow among the younger ones. But, as a matter of fact, it is not so. Even if the ratio is calculated on 10,000 persons aged ten and upwards, it is seen that those who are 60 years old and over number only 542 among the Christians, as compared with 623 among the Hindus. Generally speaking, the difference in the mean age of the two main religionists may be taken to show that the Christians are more prolific than their Hindu brethren, but are relatively short lived.

67 The births depend upon the number of married females at the ages 15—40, which are taken to include the reproductive period.

Fecundity For every one hundred females, there are, in the State as a whole, 32 women at the child-bearing ages. The ratios for

the two natural Divisions lie on either side of the State average—being 31 in the Western and 33 in the Eastern Division. Among the Administrative Divisions, Kottayam possesses the highest proportion of wedded women at 15—40, being 31 per 100 of the sex, and Trivandrum the lowest, 30. Compared with the 1901 Census, the ratio of the married females at the reproductive ages is seen to be now less in every Division and in the whole State. It is remarkable to note that, side by side with this decrease, there has been an increase in the population under 10 years of age with reference to the married females at the child-bearing ages. In all Travancore, the children number 171 to 100 married females at the reproductive ages. The ratio in the Western Natural Division is higher, and that in the Eastern lower, than the State average. Thus, the proportion of children stands highest in the Division where the ratio of married women has gone down the most. The influence of race, the rate of infantile mortality due to climate, customs connected with child-birth, the manner of feeding and the degree of care with which children are brought up, the age at which girls are married, the existence of preventive checks and the material condition of the people—these are the chief causes that are generally suggested as influencing the rate of fecundity in a given population. None of these causes can be supposed to operate in any part of the State with such distinctive intensity as to bring about perceptible variations. But, if any factor may be said to be at work, it must be the one which governs infantile mortality. It is difficult, however, to

analyse its operation, Division by Division, so as to be able to measure and compare its effect in each. As has already been pointed out, Vital Statistics registration has not yet attained the level of accuracy needed for a correct interpretation of duly recorded Census statistics, and it therefore serves no useful purpose to dwell on the subject any further. For the sake of reference, however the reported Birth and Death rates are embodied in two Subsidiary Tables appended to the Chapter.

68. There is another direction, however in which the mortuary returns may be utilised. Statistics of births and deaths for the whole State are available by the month for a period of nine years from 1896-'99. In view to see whether any indication could be obtained of the general bearing of the different periods in the year on the vital history of the population, the average

Diagram showing the average monthly number of births and deaths for 10,000 of each reported yearly during the period 1896-'99 to 1903-'04

Note. — The month in which the births and deaths occurred is shown at the bottom, and the probable month of conception at the top, of the diagram.

number of births and deaths per month per 10,000 of each year have been calculated from the returns and embodied in the marginal diagram. The curves therein portray the variations of the monthly averages with reference to the annual mean. The months given at the bottom refer to those in which the births and deaths were actually reported, while the months at the top denote the probable time of conception, *i. e.*, nine months earlier. The birth line shows that the reproductive principle is most active between the months of August and November. The Malabar era commences from the middle of August, and with the new year the South-West monsoon nears its close the agricultural operations have been completed and the harvesting of the crops is looked forward to. Then is the Onam season when Sambandham-marriages are largely celebrated among the Marumakkathayee Hindus. From the close of November however the generative activity appears to diminish and barring a slight rise a month later continues to decline steadily. The curve however oscillates above the mean till February. Fecundity reaches its minimum in the hot weather March to May. A slight recovery is noticeable in the month of June. The burst of the South-West monsoon refreshes the country and the reproductive forces begin to assert themselves. A month more and the period most favourable to conception opens out. The curve rises and transcending the normal in August reaches its zenith in October.

In regard to deaths it is seen that the rate goes below the average in the warm months, and reaching the lowest point by the middle of May mounts up to the normal when June closes. It rises considerably above it during the next three months, but falls again in October. In another two months, however the death line shoots up and the rate stands in December the highest in the year. The North-East monsoon ushers in the season of disorders. The land breeze that prevails

helps to aggravate the situation and the dewy season which soon overtakes the country completes it. After December, the death-wave tends to subside, but continues still above the mean. It is about the middle of February, the line crosses to the lower side, only to reascend the old level in another thirty days.

Broadly viewed, then, the seasonal variations show that October marks the parting of the ways as regards gestation and December in respect of mortality. The reproductive principle steadily gains in effectiveness from April onwards, till it becomes strongest in October, and then declines till it fades away again in April. Mortality too is at the lowest ebb in April, but it steadily rises until about December when the amount of conception tends to be lower than the normal, and death reaps its largest reward. From January, the birth and death ratios move in opposite directions, the former on the side of increase and the latter on that of decrease. How far these facts can be made to sustain any theory of correspondence, is a matter for more extended observations.

69 Sixteen castes have been selected, and the age distribution in 1,000 of each is shown in Subsidiary Table IV. As the statistics do not lend themselves to detailed treatment, no definite conclusions may be deduced. It is, however, observed that castes which are engaged in sedentary occupations show relatively small proportions of children and a larger number in the higher ages. Both sexes taken together, the castes which have returned the highest ratios of persons aged 40 and over are the Konkarnis (276), Brahmans (276—278) and the Vellalas (246), while the Tantāns (168), the Pulayas (181) and Īzhavas (184) come at the other extreme. An idea of the longevity of the different castes may be roughly gathered from the figures, but it has to be noted that the proportions are also influenced by their comparative fecundity. The proportion of children, however, under five years of age does not adjust itself on any basis. The Konkarnis (88) and the Malayala Brahmans (86) have the smallest number of children under 5 years of age, while the non-Malayala Brahmans and the Vellalas show high ratios, 153 and 126 respectively. In regard to the other castes, the proportions are low, but are not all the lowest—Tantān (113), Īzhavas (123), Pulayas (138).

70 The details in regard to the ages of the centenarians recorded at the Census are summarised in the margin. They show an improvement in longevity during the last decade—a result in general consonance with the reduction in mortality in the upper years of life. There are now 24 males and 22 females who are of the ages 100

Age	Religion	Males	Females
100	Hindus	9	8
	Musalman	1	1
101	Christian	1	1
	Hindu	1	1
102	Hindu	1	1
	Musalman	1	1
103	Hindu	1	1
	Musalman	1	1
104	Hindu	1	1
105	Hindu	2	1
106	Hindu	1	1
107	Christian	5	1
108	Hindu	1	1
109	Christian	1	2
110	Christian	1	1
111	Christian	1	1
112	Christian	1	1
113	Christian	1	1

and above, or 19 and 8 respectively more than at the 1901 Census. The Hindus claim the largest number of them in both the sexes—14 males and 13 females, but the Christians possess the oldest of them, there being three whose ages have been stated as 114, 118 and 119 years respectively. It has not been possible to institute any special enquiries as to how far the claims of the centenarians brought to account are tenable. Perhaps, they are exaggerated in some cases. However, as between one Census and another, the results need not be taken as vitiating a comparison, and thus viewed, the satisfactory feature disclosed by the returns deserves record.

SUBSIDIARY TABLE IA.—Age distribution of 100,000 of each sex by annual periods.

AGE	MALE			FEMALE			AGE	MALE			FEMALE

CHAPTER V.

SEX.

(TABLE VII)

71. The numerical proportion between the sexes varies in different countries and among different peoples. In some, there are more men than women, in others more women than men. In the United States of America, women are fewer than males, numbering 943 per 1,000 of the latter. So also in Canada, where the ratio is 952 to 1,000. Among the aboriginal races and tribes, however, females are said to be in a majority, and in some cases thrice as numerous as the males. Among the peoples of Africa, the cases in which the men preponderate appear few and far between, but in Egypt there are found only 992 women to 1,000 of the other sex. In Australia the men generally out-number the women. The reverse appears to be the case in the west of Asia, such as Syria, Armenia, and the three Arabias. Women exceed the men among the Chinese, while in Japan they count up only to 960 to every one thousand of the other sex.

In India too, the number of males at birth is greater than that of females, but unlike in Europe, the males maintain the excess in the actual population. In 1901, the proportion in all India was 963 females to 1,000 males. At this Census, there is even a greater excess of males, the ratio of the fair sex having fallen to 953. The difference, however, even if taken as real, is not considered sufficient to

* The Census years to which the proportions relate are as below—Countries 2, 3, 4, 12 & 15—1911, 5 & 7—1910, 9—1909, 13—1907, 8 & 11—1901, 1, 6, 10 & 16—1900, 14—1899.

account for the relatively high ratio of males as compared with females, in the enumerated population.

If the figures for the different Provinces and States within India are examined, considerable local variations are noticed. The marginal diagram illustrates these variations as per the 1911 Census.

In only four out of the fifteen units shown therein does the ratio of females exceed one thousand as against a corresponding number of males. But even here the Province which stands first, namely Madras, occupies among the European countries only the seventh place next above the German Empire

Several reasons are suggested to explain why India should exhibit a phenomenon the reverse of that in Europe and that, in spite of a correspondence more or less at life's start. They are chiefly—(1)

female infanticide (2) neglect of female infant life (3) premature child bearing (4) unskillful midwifery (5) bad feeding of women at puberty and confinement from air and light during the menstrual period and in the puerperal state, (6) the hard life of widowhood, (7) the exhausting labour which women of the working classes have often to perform, and (8) adverse conditions generally of climate, nourishment, accommodation, &c. These result, it is stated, in a relatively high mortality among females. The supplemental theory of female omissions is also put forward. This theory rests on the *a priori* probability of such omissions in view of the jealous reserve of certain communities regarding their womankind, on the seen rise in the proportion of females at each successive enumeration, on the marked lowness of the proportion at the very ages when omissions may on the grounds anticipated be looked for and lastly on the assumption that carefully collected vital statistics of modern European countries must more faithfully represent the normal than figure recorded elsewhere

But it has to be remarked that the proportions in European countries are disturbed by the large movements of the different peoples to and fro and that but for this migration several of them would return different sex ratios. However on the basis of what is found actually existing in Europe the Indian figures are examined and local conditions and artificial causes appraised, which, while they may produce in some places a heavy mortality among females, probably stand in the way of the entire female population being brought to book in the case of others.

These preliminary observations summarise the aspects presented by the statistics in Europe and India and some space has been devoted to them as they help in understanding the general bearing and importance of the subject matter of the Chapter and the points from which it admits of being viewed.

72. Though all the Imperial Tables give the population by sex, the one most utilised for this Chapter is Table VII where the sexes are shown in conjunction with age and civil condition. The following Subsidiary Tables illustrate the features relative to

the subject.

See source to
Table VII.

Diagram showing the number of females to 1,000 males in certain Indian Provinces and States.

Each diamond represents 50 females.

See also Table I—Giving the proportion of the sexes in each Division at the last four Censuses.

See also Table II—Showing the number of females per 1,000 males at different age-periods, by religions.

See also Table III—Showing the number of females per 1,000 males at different age-periods, by Natural Divisions.

See also Table IV—Showing the proportion of the sexes in certain selected cities.

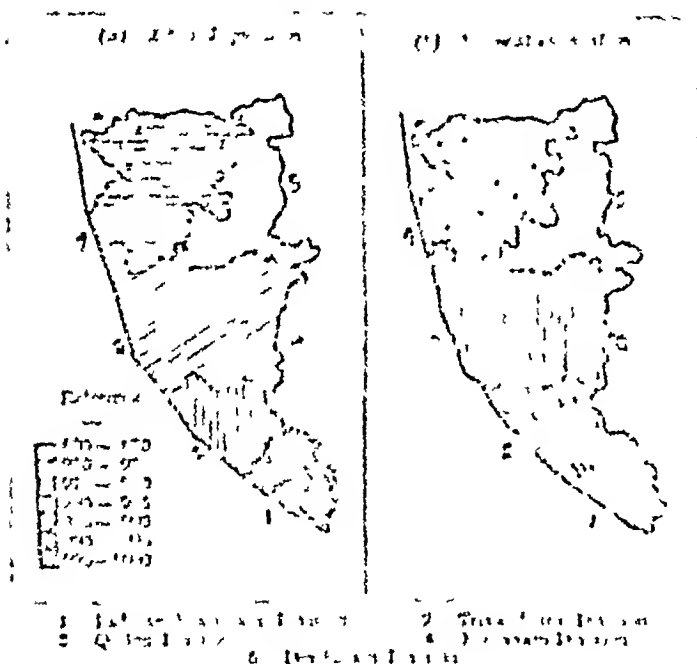

See also Table V—Giving the actual number of births and deaths during the last 10 years from 1895-96.

73. In the total population enumerated at the Census, there are 951 female to every 1,000 male. In the Western Natural Division, the proportion of females would be 987 to every 1,000, while in the Eastern Division it would be 944. If the ratios in the Administrative Divisions are examined, it is found that 1,181 of them females

are a minority, but least so in the southernmost Division of Padmanabhapuram,

where the two tend to get equal. The proportion decreases towards the north, there being a sudden drop in the adjoining Division of Travancore (944). The small rise to 987 in Quilon is accompanied by a fall to 977 in its northern neighbour, Kottayam. The deficiency of women is greatest in the Devikulam Division where there are only 805 females for every 1,000 males.

In the natural population, i.e., the population born within the State, enumerated at home or abroad,

the ratio of females to 1,000 males is only one less than in the case of the actual population, which takes in the immigrant and excludes the emigrants. Among the arrivals, the proportion stands at 983 women per 1,000 of the other sex, while among the outgoers, it is 945 to a like number of males. The disturbance due to the migratory movements of people from and into Travancore may be taken as almost imperceptible. In the Western Natural Division, the natural population shows a lesser ratio of females than the actual, 951 against 987, while the reverse obtains in the other Division, 976 against 971. Among the Administrative Divisions, Travancore and Devikulam return higher proportions—996 and 860 respectively, as against 984 and 805, while, in the other three Divisions, it is less—Padmanabhapuram, 990 against 997 in the population actually censused, Quilon 951, as compared with 987 and Kottayam 974 against 977.

74. The figures for the main Provinces and States are embodied in the diagram on page 193 *supra*. It is seen herefrom that the proportion of females to 1,000 males is higher than in Travancore only in three Provinces and one State the remaining ten coming below it. The lowest ratio is exhibited by the Province of Coorg where for every thousand men, the other sex numbers 201 less, as against a deficiency of 19 in this country. Of the bigger States, Mysore alone has a ratio close to that of Travancore 979 against 981. In all India, the proportion is less than in this State by 28 and if the population of the British Indian Provinces only is taken and compared, the difference between the two ratios would stand reduced from 28 to 25.

75. Since the Census of 1901 there has been no variation in the proportion of the sexes, and the ratio has continued at 981 females to 1,000 males. In the Natural Divisions, however there has been a decrease in the Western from 991 females per 1,000 males to 987 and an increase in the Eastern from 987 to 971 of the former sex to a like number of the latter. In the Administrative Divisions, there has been a rise throughout, except in Padmanabhapuram.

The relation of the sexes, when considered and compared by age-periods, shows that, during the last decade the number of females to every 1,000 males has—

fallen in the age-period	0—10
gone up	10—20
decreased	20—30
increased	30—40 and
decreased	40 & over

In the ages under 30, there were in 1901 1,024 females per 1,000 males, as against 1,014 in 1911. But the ages 30 and over now shows an increase in the ratio of females to males, being 917 as compared with 903 at the preceding enumeration.

76. The disproportion between the sexes will now be examined on the lines indicated *supra*. The Vital Statistics returns for the State as a whole show that, as elsewhere more males than females are ushered into existence. In the decade 1900-'01 to 1909-'10 there have been born 30 more of males to a thousand of the other sex. If the figures for the 37 special localities placed under observation (*Vide* para 43 of Chapter II) are examined, the proportional excess of male births goes up to 116 or about four times that deduced from the general registration accounts. Nevertheless, on the analogy of what obtains in Europe the difference between male and female births may not be considered sufficient to warrant the observed disproportion between the sexes, even with the added assumption of a heavy mortality among females. And in view of "the fashion to judge of the accuracy of an Indian Census by the nearness with which the female total approaches that of the males," the tendency is to suspect at the very outset the correctness of the sex record. The reliability of the statistics therefore will first be examined.

Incompleteness of enumeration—The unprecedented increase in the population as enumerated by a responsible official agency disposes of the presumption of perfunctory counting. Nor do the figures lend support to any such suspicion. In four out of the five component Divisions of the State women have progressed at a higher rate than men, the excess in Devikulam being as much as 3 per cent.

Concealment of females.—With regard to the theory of wilful suppression of females, the observations made in the 1901 Census Report need only be recalled here, with the added force of a decade of general change in men's feelings in such matters.

Local conditions.—In these circumstances, the disproportion between the sexes has to be explained with reference to material and social conditions, which are taken to induce a relatively high mortality among females. It is not possible in the present state of information, to measure the extent of applicability to Travancore of the several factors regarded as being in operation in India generally towards producing a similar result. And unless such measurements are made and the results co-ordinated with the sex proportions, the investigation cannot be said to serve its purpose. What is permissible, however will be done and that is to indicate the broad directions. In regard to some of the factors, such as female infanticide, they have only to be mentioned and rejected. In the case of some others, such as neglect of female life, it may be pointed out that, in view of the position which women occupy in the domestic and social constitution of the majority of the population the attention paid to them is, at the least, as much as males receive. As regards another factor viz hard life of widows, it may be remarked that immutable widowhood is itself confined to a small section of the population, and even here it cannot be said that life is harder than in the case of the married or the single of the sex. Unskilful midwifery is urged as yet another factor against women. It has, however been seen in Chapter II that a vast improvement has already taken place in the matter of providing the people with trained aid, and they are availing themselves of it to an increasing extent. Without dilating further on the subject, it may be observed that, so far as the question hinges on the care with which female life is reared and the treatment accorded to women, Travancore presents an aspect decidedly more favourable than many other parts of India.

77 Viewed in relation to age, the numerical proportions of the two sexes
Sex and Age. present the following features—

Excess of females at the ages	0—8
Defect of females	9—14
Excess	15—20
Defect	20—25 and
Excess	25 & over

At the ages below 20, females outnumber the males by 14 to a thousand while among those who are thirty years old and above they are in defect to the extent of 63 per 100 male.

These features are reflected in detail in both the Natural Divisions and the figures for the latter need not, therefore be gone into. They will be found recorded in Subsidiary Table III.

Viewing it from the point of view of the population as a whole it may be said that reference is made to the female members of the family within certain limits as to their connection with the Census schedules. Among the Maranathas, however, by reason of the way in which the population is composed of equal importance with men, if we were to employ a system of personal freedom, there are at least as much valued and cared for as boys, as far as they are sources of service both to the family and to the community. They are the chosen by both the family and the community. The female system is unknown among the Maranathas and the Christians, and it is known to the other communities. It is confined to a numerically insignificant portion of the population—the Maranathas, the Christians, and the Muslims. The Census enquiries about women have not been regarded as an interference in domestic privacy and the families have not sought to conceal any of their women from the Census. They are now the same as in the past. — Travancore Census Report, 1901—Page 24.

78 Of the three main religionists, the Hindus possess the highest ratio of females to males—993 to 1,000. The Christians come next with a proportion of 960, followed by the Musalmans with 915. When compared with the ratios at the 1901 Census, they are higher in the case of the Hindus and the Muhammadans, by 3 and 10 females respectively. Of the two Natural Divisions, the Western Division returns higher proportions in respect of every religion. Here, in regard to the Hindus, the sexes almost equal, there being 998 females to 1,000 males, while in the Eastern Division the ratio of females goes down to 981. The difference between the two Divisions comes out most marked in respect of the Muhammadans. With preponderating numbers in the sea-board regions, they are able to show 960 females to 1,000 males, while in the interior tracts, as many as 76 women are wanting to balance the other sex.

All the three religions show an excess of females at the ages below 30, the Hindus returning the highest ratio 1,020, followed by the Christians (1,002) and the Muhammadans (1,001). At the ages 30 and above, females are in a minority everywhere. However, the religionists stand in the same order, the Hindus first (913 females per 1,000 males), then the Christians (873), and lastly the Muhammadans (835). At the ages 60 and over, females out-number the males by 119 to every 1,000 among the Hindus, while among the Christians and the Muhammadans they are in defect by as many as 32 and 111 respectively. If the proportions at the ages below 5 are compared, it is seen that girls predominate in all the religions, most among the Christians (1,058). The Hindus follow with a proportion of 1,039 per 1,000 boys, the Muhammadans showing the smallest ratio of excess (1,036).

79 It was observed in the Report on the Census of 1901 that, so far as Travancore was concerned, no relation appeared to have been established between castes and the proportion of the sexes. The assumption on which such a relation was to be sought for was based on the supposed tendency for the ratio of females to males "to vary inversely with the status of the caste, so that it is highest in the lowest castes, and lowest in the higher." But it was found from actual figures that "the phase of the marital institution to which the tendency above noted is traceable are not, with the bulk of the people, the inevitable concomitants of social status and that a high position in the scale of precedence does not connote the adoption of early marriage or the prohibition of widow-marriage, both of which are generally known to be important regulating principles in the ordering of society. *Teste*, the Nāyars, high in the scale, but among whom remarriage is far from uncommon. Among the Nampūtiri Brahmans, the highest caste in Malabār, marriage takes place after puberty, and women sometimes continue single throughout life."

This position still continues. Sixteen representative castes have been selected and their sex proportions entered in Subsidiary Table IV. The Malayāli Brahman shows, no doubt, the lowest ratio of females, 768 to 1,000 males. But among the Nāyars, the proportion stands as 1,004 women to 1,000 men. At the end of the scale come the Parayan with a ratio of 1,008 females and the Pulayan with 985. Between these are found all manner of relations which it is difficult to reduce to a common intelligible tendency.

The same difficulty is experienced if the proportions at the different age-periods are taken up and examined, and it serves no useful purpose to pursue a subject in which the factors that have to be taken note of are so varied and the conclusions that may be come to so uncertain.

80 *European theories*.—The problem of the causation of sex has engaged attention in all ages. The theories put forward have been innumerable but no satisfactory solution appears to have been come to.

The views of European inquirers are summarised by Geddes and Thomson in their book on the Evolution of Sex and by Edward Westermarck in his History of Human Marriage. The scientific views fall under two groups: one of which postulates a fundamental difference in the sexual cells themselves. No definite evidence however is stated to be forthcoming on this aspect of the subject. The second group of theories regards external conditions as determining the sex. Recognising the importance of such conditions, Geddes and Thomson have by their researches, come to the conclusion that the female is the outcome and expression of relatively preponderant anabolism, and the male of relatively predominant katabolism.† And they maintain that future developments of the theory of sex can only differ in degree, not in kind, from that suggested inasmuch as the present theory is, for the first time an expression of the facts in terms which are agreed to be fundamental in biology—those of the anabolism and katabolism of protoplasm.‡ However the writer on the Determination of sex in the latest edition of the Encyclopædia Britannica, remarks in reference to these scientists that “their view ranges many diverse facts in apparent harmony but has to encounter many facts that apparently contradict it. And he adds that in a later work J. A. Thomson himself (1907) assigns less weight to his own theory and quotes with approval T. H. Morgan’s suggestion that the determination of sex may be brought about in different fashions in different cases. The question, therefore as to how the sex is determined during the nine months ante-natal gloom may still be regarded as an open question. In the further query *when* in *extra-uterine* life the sex of an organism is absolutely decided, no general answer has yet been given.

Hindu theories.—Many of the modern theories regarding the causation of sex have been anticipated by ancient Hindu writers. The idea underlying many of these theories, ancient and modern is that sex is determined by the preponderance of the male over the female principle or the reverse at the time of conception.”‡

The sixteen days commencing with the appearance of the menstrual flow constitute the season of gestation according to Manu. Of these, even days are said to favour the procreation of the stern sex and odd days of the gentle. The fourth day or the day of the bath gives a weak offspring shattered and ineffective. The force of conception on the seventh day is not sufficient to impress the offspring—which of course is a female—with the power of reproduction. It is a sterile child that is then born. The eighth and ninth days produce excellent male and female

Ever since Aristotle’s days physicians have sought to discover the cause which determines the sex of the foetus, but no scientific explanation of general nature has yet been arrived at. The History of Human Marriage by J. A. Thomson, 1907, p. 680.

At the beginning of the 14th century the theories of sex were estimated at so many as five hundred, and they have grown on increasing. The number of speculations as to the nature of sex has been well-nigh doubled since Descartes in the 17th century brought together two hundred and sixty-two gross Sanshyphisms, and since his death has gradually increased to nearly a million more than this. Descartes’ own theory found the two hundred and sixty-third. Subsequently it was the basis of another hundred and thirty-five Sanshyphisms. The History of Human Marriage by J. A. Thomson, 1907, pp. 33 and 34.

Such conditions as deficient or abnormal food, high temperature, deficient light and store, and the like, are said to result in the preponderance of waste over repair—the relaxing & static habit of body—and these conditions tend to result in the production of males. Similarly the opposed set of factors, such as abundant and rich nutrition, also tend to favour a more constructive process, &c., which for relatively active habit and these conditions tend to result in the production of females. With some leaves of uncertainty we may also include the influence of the age and physical condition of the female at the period of fertilisation. Ed. p. 83.

Original Causes of sex.—P. p. 330

children respectively. So are the tenth and twelfth, fourteenth, fifteenth and sixteenth, the sex varying with the oddness or evenness of the number. The development of the ovum impregnated on the eleventh and thirteenth days after the flow is not considered satisfactory in any respect. It is also laid down that under-feeding of the women during the reproductive season of the month lessens the chance of begetting female progeny.

In regard to the effect of dietary, it is believed that over-feeding of the maternal parent favours the procreation of the female sex, and moderate feeding, of the male, and that when to deficient feeding over-work is added, sterility must be looked for. It is stated in illustration that girls are more numerous among the sedentary classes living in towns, that more boys are born to poor parents and residents in villages, and that, in the bovine kingdom, the taboo of hard labour for cows has its reasons in the fear of consequent infertility. The view in regard to the evolution of sex in the human species is shared by the great Indian poetess, *Auvvar*, who, in an oft-quoted couplet, has sung "*untichurunkuthal pentirrhazhaku*" (Spare diet is good for women). The creation of female bees by means of special feeding—a feature well-known in the history of the insect world—may be recalled in corroboration of this theory.

Enquiry with the aid of Census statistics—In the 1901 Census Report of Bengal, the question was fully discussed as to what extent local conditions supported or contradicted the theories put forward as influencing sex, and the inference drawn was that no connection could be traced between the proportion of the sexes at birth on the one hand, and climate, altitude, nutrition, life led by women, famine or season of gestation, on the other, but that possibly race, polyandry, relative ages of husband and wife and long continued female infanticide might have some influence. The discussion was extended in the All India Census Report to other Provinces, but the conclusions which the statistics led to were not consistent and the influence of the several factors varied in different places.

The investigation therefore of the subject, in the light of Census statistics, can hardly be pursued with any advantage, especially with reference to a small State like Travancore. However, as the main problem is of interest in connection with the Chapter on sex, its stand has been briefly noticed for purposes of general information.

SUBSIDIARY TABLE I.—General Proportions of the Sexes by Divisions.

CHAPTER VI.

MARRIAGE (TABLES VII AND XIV)

81 The statistics relating to the civil condition of the population are embodied in Imperial Tables VII and XIV, combined with age and religion in the former and with age and certain selected castes in the latter. The Subsidiary Tables are, as usual, intended to show the prominent features of the statistics reduced to proportional forms. They are —

Reference to
statistics

Subsidiary Table I — Showing the distribution by civil condition and religion of 1,000 persons of each sex at certain age-periods

Subsidiary Table II — Showing the distribution by civil condition and religion of 1,000 of each sex at certain age-periods for the State and for the Natural Divisions

Subsidiary Table III — Showing the distribution of 10,000 of each sex by civil condition and religion

Subsidiary Table IV — Showing the proportion of the sexes by civil condition and religion at certain age-periods for the State and for the Natural Divisions

Subsidiary Table V — Showing the distribution by civil condition of 1,000 of each sex at certain ages for selected castes

82 Of the male population in the State, 51 per cent, and of the total females, 44 per cent, are returned as unmarried. The sexes show the same proportion in the married state, 41 per cent, while widows are more than thrice as numerous as widowers, 14 against 4 per cent.

General features

Viewed with reference to age, the males return 39 per 100 as single

Diagram showing the proportion of the unmarried, married, and widowed at each age period

NOTE — For the purpose of this diagram the unadjusted ages have been taken

per cent out of their aggregate population. As regards the widowed in either sex, all ratios with reference to the total number of people vanish at the younger years

at the ages below 15. The corresponding proportion for females is 38. In the age-period, 15—40, males unwed form 15 per cent of their entire strength, while unmarried females constitute only 6 per cent. The ratio goes down to three per mille of each sex at the ages, 40 and over. In the married state, the highest proportion is returned in the age-period 15—40, males yielding 25 per cent and females 32

of life even if a ratio of 1,000 be taken. With 10,000 as the basis, the proportions become just visible and a girl appearing at the period 10-15 bereft of her husband and one boy bereft of his wife. The proportion of children under ten years of age who have had their share of the experience of maternal and widowed dwellers down to one in a total of 10,000 in each sex.

The marginal statement which distributes the population in each civil condition according to age presents the same subject from another view. Nearly three-fourths of the bachelors and over four-fifths of the maidens seem to be of the

Distribution by age-periods of 1,000 each
civil condition

Age-period	Males			Females		
	Unmarried	Married	Widowed	Unmarried	Married	Widowed
0-10	47	8	2	418	11	1
10-15	219	4	4	219	4	8
15-40	279	201	205	131	171	173
40 & over	8	403	640	7	204	780

age under 15 nearly three-fifths of the total number of husbands and more than three-fourths of the aggregate number of wives are found at the ages, 15-40 and the distribution of the widowed population in its sex shows that 80 per cent. of the widows are aged 40 and over while the ratio for widowers at the higher ages is 60 per cent. These are the broad features of the statistics. Comparison with other Provinces and States would show to what extent Travancore shares the characteristics observed in India generally but the latest figures are not available. However when at the Census of 1901 such a comparison was instituted, this State presented a distinct difference in respect of the marital condition. Marriage was found to be comparatively less universal juvenile marriage less common, and immotable widowhood less prevalent than elsewhere. Nothing has transpired during the last ten years to alter the main aspect of the situation. To bring out clearly what ever difference there is the distribution of the population at each age-period in the unmarried, married and widowed, will be examined, with special reference to early marriage and widowhood.

83. ALEXANDERSON'S proportions of the three states in each age-period disclose the unreality of the unmarried condition at the earliest ages and of the married at later periods. Not one of either sex returned as married at an age below 5 (10 for males living in the next period, 5-10

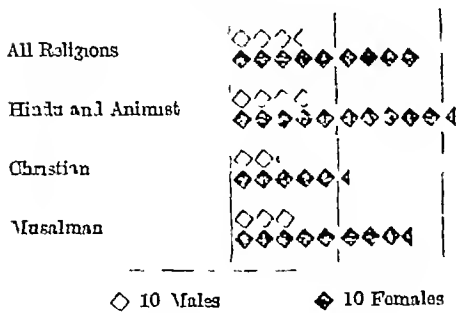

by 10 for males and 3 males per 1,000 of each sex were seen to have been married out of the unmarried state. Even at the succeeding quinquennium 10-15 the tendency to enter the married state is but faintly disclosed in the case of males but in regard to females the married per 1,000 of the sex at these ages rise to 81 which is more than nine times the ratio for males. It is when the age of 16 is reached that marital life gets into disfavour more so with girls than with boys. In every age group and girl in the age period 15-20 the number was reduced to 40 while the three next older

mount up to 863. The unmarried condition gets very scarce even in another five years in respect of both the sexes.

84. Among children aged 0-10 the widowed and widower turn out the Census number respectively 11 and 6. If the next age quinquennium is taken the number of widowed is 400 in the case of male and 511 in regard to the other sex. Reduced

to a base of 10,000, the population in each sex at the ages, 0—15, gives 6 widowers and 14 widows. At the ages, 15—20, when, as has been seen, wedded life may be

Diagram showing the number per 1,000 aged 15—40 who are widowed

taken as more or less assured, 6 in every 1,000 boys are returned as widowers, the proportion among the fair sex being 24. The condition of women darkens after the age of 20, and the greater the number of these that seek wedded happiness, the greater also the number that have to face the wrench of separation. At the age-period, 20—40, for every hundred husbands there are 5 males whose collaborateurs in life have

failed them, while females in that predicament number 13 per 100 wives. At the highest age-period, 60 and over, the widows appear to swamp the field. Against a tale of 831 forlorn in 1,000 women aged 60 and over, the bereaved of the other sex with their contingent of 294 appear nowhere. When compared with the ratio of the married at these ages, there are for 100 husbands 42 men who have lost their wives, while per 100 wives, the widows tell a tale of 540.

85 If the Hindus, Muhammadans and Christians are compared with one another, it is seen that, in a thousand of either sex, the Muhammadans return the highest ratio of the unmarried, the Christians stand first in respect of the married, and the Hindus form the vanguard among the widowed. The widows among the Hindus are thrice, among the Christians less than thrice, and among the Muhammadans four times as numerous as the widowers among the respective religionists.

Religion	Number of widows per 1,000 females in the age-period			
	15—20	20—40	40—60	60 & over
Hindu	26	127	479	851
Muhammadan	28	101	482	826
Christian	8	68	377	769

The distribution of the population in each age-period, according to civil condition,

shows some variations. It will suffice if the females alone are noticed. At the

Diagram showing the proportion of the married per 1,000 of each age period by religions

ages, 5—10, 99 per cent remain unmarried in the three religions. In another 5 years, however, a difference appears and becomes pronounced at the ages, 15—20, the comparison going against the Christians. The Hindu maids with a ratio of 457 per 1,000 females take a long lead of the Christians with a proportion of 292. The Muhammadans occupy a middle position. The relatively high number of unmarried women is maintained by the Hindus at the higher age-periods too. Again, in respect of the widowed,

At the highest age-period, 60 and over, the widows appear to swamp the field. Against a tale of 831 forlorn in 1,000 women aged 60 and over, the bereaved of the other sex with their contingent of 294 appear nowhere. When compared with the ratio of the married at these ages, there are for 100 husbands 42 men who have lost their wives, while per 100 wives, the widows tell a tale of 540.

the three religions do not differ from one another in the ages below 15. Nor is the difference great at the period 15—20. Though the ratio rises thereafter in all the religions, the Hindus appear to be in the least favourable position as will be seen from the figures entered in the margin.

66 The extent to which early marriage prevails is brought out by the proportional staff line embodied in Subsidiary Table V in respect of 16 castes. Between the ages 5 and 12, the highest ratio of married females is returned by the Brahmans, 25 per 1,000 among the Malavli Brahmans and 16 among the other Brahmans. The Konkavis and the Vellilas follow in order with the next highest proportions. At the ages, 13—20 the married state prevails generally. At the age period, 20—40 in every one of the 16 selected castes, the ratio of married females stands over 700 per 1,000 of the sex. It is at this period of life too that the proportion of widows begins to rise considerably ranging from 60 among the Pulayas to 164 among the Konkavis.

67 During the last two years, the proportion of the married has been on the decrease in both sexes while there has been a rise among the unmarried. In respect of the widowed, the lot of the female has remained unchanged while the widowers have lessened. When viewed with reference to age, it is seen that, in the periods of life below 15 the ratios of unmarried and the widowed in both sexes have gone up, while there has been a fall in the married. This feature is kept up at the subsequent age-periods by the unmarried. As regards the wedded, however the ratios of husbands and wives at the periods, 40—60 and 60 and over seem to have grown. In respect of the widowed, an advance is noticed at the ages below 20. At the period, 20—40, the widowers show a decrease and the widows a rise during the last decade. In regard to the bereaved of both sexes at the last two periods of life it is seen that the enhancement which marked the Census of 1901 now gives place to a diminution.

68. The number of females per 1,000 males stands lowest among the unmarried and highest among the widowed, the ratios being 104 and 3,341 respectively. The wives number 20 less to every 1,000 husbands. Viewed with reference to age the proportion of females to male shows from the early ages onwards a decline in respect of the first of the civil conditions and a progress as regards the last. Below the age of 10 maids are in excess of bachelors by 17 in every one thousand but by the age of 15, they get scarce to the extent of 141. In the period, 15—40 the number diminishes to less than two-fifths of the unmarried males and reaches the limit of 3.5. If the farther ages of 40 and over are considered together the two sexes tend to equality. In the case of the widowed on the contrary the females are throughout in preponderance, the males being nearly twice two and a half times, three and three and a half times respectively at the four age-periods taken up for comparison, the actual ratios being 1,917, 2,492, 2,670 and 3,430 respectively per 1,000 males. As between the married in both sexes, the relation is subject to no regular sequence and the disproportions are very marked at the several age-periods. Theaphase however is but the reflection from another side of the conditions things seen to prevail among the widowed females. The ratio of girl wives to boy husbands which is as two to one at the ages below ten, more than quadruples in another five years and becomes as nine to one but from this height it drops suddenly till it slides almost to a level at the period, 15—40. The decline even continues further till the proportion of

females shrinks to less than one-half at the higher ages, being 491 per 1,000 males in the period, 40 and over

89 The marriage alliance according to the Indian ancients falls under two broad groups —(1) Dharma Vivāham or canonical marriage, and (2) Kāma-Vivāham or Carnal marriage Under the first are included, Brāhman, Daivam, Ārsham, and Prājāpatyam Under the second are comprised, Āsuram, Gāndharvam, Rākshasam, and Pāisākam

The first class or canonical marriage is also describable as social marriage, as the primary object of the alliance is to enable certain appointed duties to society (Dharmas) being performed and to provide for those duties being continued to be performed in the family, even after the death of the individual married Hence, the married or *grahasta* stage of life is considered a very important one on which the other stages *viz*, Brahmachārī, Vānaprasta and Sanyāsī, most vitally depend For the purposes of such alliance, the selection of suitable partners is an all-important pre-requisite By a division of labour between husband and wife, the former undertakes, in addition to social duties, the guardianship of the wife's interests, both temporal and secular, and the latter holds herself responsible for all the domestic functions This tie of interdependence knits the two in permanent union, and safeguards it against danger from the possible effects of time on the body and mind of either partner These advantages are conspicuous by their absence in the other type of marriage known as Kāma Vivāham, where the object of marriage is individual, and where each seeks to get the best partner suited to his or her personal taste and happiness Here, the children being only the bye-products of a convenience-alliance, the question of the ownership of the off-spring has, to judge from the history of human marriages, often arisen as a separate question Manu* has emphasized the principle that dominion over the soil must precede the title to its produce and has declared, in its application to human society, that when marriage does not make the wife the rightful belonging of the husband, either as collaborator, ward or both, the right over children cannot be authoritatively claimed by the father, nor can responsibility to them be enforced against him The Puranas contain references to such instances of child-right Vyāsa was claimed by the father, Pāndu and Upasloka by the mother It may also be mentioned that marriage was at one time not a universal institution among women in India There were the *Brahma-Vādins*, corresponding to the *Nitya-Brahmachāris*, who, not wishing to take on the functions of married life, went through the Upanayana ceremony like their male fellow-born, learned Vedas and performed the *homās* and other rites prescribed for the Brahmachārī The other class, *viz*, social females were called *Sadyovadhū*s They sought the same supreme goal as their Brahma-Vādin sisters but through service To them, Vivāham was Upanayanam, and the husband was the Guru Referring to this class, says Manu

Valvāhiko vidhistrinām
Samskāro valdikasmritah
Pativāyā gurau vāsō
Grihārtthōgul parikriva

By way of general remarks, it may be stated that the modern tendency of matrimony in the West is, with the growing approximation of ideals and aspirations between the West and the East, beginning to show themselves here as well Although the fixity and the inviolability of the marital tie, while it lasts *in jure*,

certain compartments of human nature fit only for treatment by moral suasion, and be done with it. On the other hand, if all the righteous indignation now levelled should have any effect worth having the causes should be discovered and attempted to be removed, with patience and diligence. What with the increasing approximation to modern countries in the number of human wants and with the steady enhancement in the cost of securing them, but at the same time with no rise in the level of income in sufficient correspondence the struggle to make both ends meet on the part of the average Indian has increased. Bridegrooms in easy circumstances relatively to the times, are proportionately less than before and brides parents or *kanyasulkis* from the proud official to the impecunious priest, are found engaged in a constant scramble for sons in law who could be trusted

in marriage to you, I have hereby given the following moveable and immoveable properties as dowry. This is now more or less a formal function, a relic of an old custom. As no Karavan of a Marumakkathayam family can give away the family properties at his own will, it is not possible to insist on the compliance of this function to it very letter. But there are rare cases where, with the consent of all the junior members, the grant is fulfilled at the spot. After enumerating such properties, he gives his blessing to the pair and pouring milk into that cadjan, hands it over to the pair. On the seventh day the husband and the wife, after bathing with turmeric, tread upon granite slab and look at the sky saying *ammijemittu Arundhatiye klanu*. The granite slab here refers to Abaira who became a stone by her immoral conduct. So the saying above quoted is evidently to indicate that the example of one who has adopted immoral ways is to be desisted and that of Arundhati the model of chastity in the world is to be followed. Then, on an auspicious day the wedded pair enter the house of the husband.

The marriage and obsequial ceremonies of the Marumakkathayee Nanyanad Vellals are similar to those obtaining among the Makkathayee Vellals (vide T. L. R. 9 page 21). The Tarwad properties are made liable for the expenses of the marriage (vide T. L. R. 31 page 17). Chief among the customs which are remnants of the old Makkathayam system and which are now followed by the Marumakkathayees are the following—

- (i) The Amra form of marriage as described above is compulsory.
- (ii) Marriages are contracted between parties of the same caste. But the Marumakkathayee Vellal is permitted to marry from his Makkathayee ancestor's families.
- (iii) The priest who officiates for the Makkavazhi Vellals also officiates for the Marumakkavazhi Vellals.
- (iv) If an elderly man dies unmarried, certain ceremonies have to be performed purporting the contracting of a marriage and then only the dead body could be cremated.
- (v) The wife should always live with her husband.
- (vi) Re-marriage is to be permitted under certain conditions viz. the death of the first husband or the execution of a Vidaman on proper grounds.
- (vii) The son should perform the obsequial ceremonies if the father. In the absence of a son, the brother's son has to perform the ceremony.
- (viii) The son entitled to a portion of the father's property.
- (ix) The person who performs the obsequial ceremonies is entitled to the ornament worn by the father or step-father at the time of his death. If there is no son by the first wife, the son by the second wife if any should perform such ceremonies.
- (x) An intercaste widow should be given maintenance from her husband's family.
- (xi) If the father is dead, the wife and children should observe pollution and perform the Shradha.
- (xii) For one year after the husband's death, the wife should not get out of the house.
- (xiii) The surname should be that of the father and not of the Karavan.

As a result of their adoption of the Marumakkathayam system, re-marriage is permitted among them and this is done just like the Marumakkathayam ceremony of the Nairs. The modes of wearing the front tuft and pottu are the same as that of the boy conversion.

(Report of the Committee on the proposed reforms in the customs of the Nanyanad Marumakkathayam in the Commission Report.)

to keep their daughters in fir compentence and comfort Further, unlike in the industrially developed countries of the West, whose style of expenditure more than that of income has been yet copied, the public service and the so-called learned professions stand in the fore-front of a young man's outlook They not only command higher respect than departments of productive labour, but English education of a certain degree of finish, the usual portal to such a career, has become the indispensable mark of a 'gentleman' who a bridegroom of a respectable household must presumably be And as comparatively poor boys with the necessary application and alertness come out successful more largely than others, the capital expended by them which, it must be admitted, has gone on increasing becomes in their case an additional factor And under the operation of the ordinary economic canons, with a boy under no compulsion, social or religious to get partnered at any, or at a particular, time, and with a girl, who *must* be married, if not at a particular time, certainly as *soon* as possible, it is no wonder that the bridegroom has become an object of—the no doubt most demoralizing—speculation in the matrimonial market Cases where, in these circumstances, the price or premium is sought to be justified as an enabler of still higher educational equipment and cases where a stipulation to so enable in due course is part of the marriage contract, are not wholly uncommon among non-Malayāla Brahmans In regard to the Malayāla Brahmans, the decline in their material condition, viewed as of a class, that has been noticed within the last few decades, has added to their standing institution of necessary marriage only for the eldest boy in increasing their difficulty in the disposal of girls Among them, very high prices are usually demanded, often to a degree little short of impoverishment to the unfortunate father And although neither rule nor custom makes ante-nubile marriage compulsory, old maids are to them no less an object of anxiety and even a source of danger and are therefore only tolerated

As for polygamy, it has never been very common in Travancore and is now getting distinctly rarer In regard to hypergamy, all that can be said is that, though a mate as high placed in society as possible, *ceteris paribus*, is of course still sought, the appreciation of compensating advantages is steadily becoming more powerful than considerations of caste and sub-caste

91 During the last decade, an attempt at social legislation has been inaugurated in respect of two important communities in the State, the Nāyars and the Nanchanād Marumakkathāya Velālas To confine attention to the aspect of marriage, it may be mentioned that on the representation of the leading Nāyars, a Committee was appointed to report, among other points, on the measures to be taken to give legal effect to the Sambandham union The Committee have toured through the country, collected evidence and reported The report is a mine of information on the subject The Committee also drafted a Bill to be passed into law That Bill has been considered by the State Legislative Council and is now awaiting final reading *

* The main provisions of the Bill relating to marriage, so far approved, are as follow

MARRIAGE AND ITS DISSOLUTION.

8 The conjugal union of a Nair female, subject to the restrictions of consanguinity and affinity, with—

(i) a Nair male, or

(ii) any male, other than a Nair, with whom conjugal union is permitted according to recognised social custom and usage,

openly solemnised by the presentation of cloth to the female by the male, whether so solemnised before the date on which this Regulation comes into force and subsisting on such date, or so solemnised after this Regulation comes into force shall be deemed to be a valid marriage for all legal purposes

In regard to the other community the Vānchanād Marumakkathāya Vellālas, another committee was appointed. The point for their enquiry in relation to marriage was divorce. The arrangement of *Vidammar* (deed of dissolution) by which divorce is now effected is, it has been reported, harmless and effective. But it is added that, with the decline in power of village heads, the system is not now in working order. Legislation has therefore been suggested. The entire question is now under the consideration of Government.

The consensus of public opinion on the question of divorce is that no dissolution of marriage should be permitted without the execution of the *Vidammar* document, as was insisted on in older days, that if divorce is to be effected without the consent of one of the parties, the party that insists on it should be made to pay compensation to the other and that if the party that receives compensation be still unwilling to effect the divorce, the amount of compensation shall be deposited in Court, which should, without going into the grounds of the proposed dissolution, determine the amount of compensation and declare the marriage dissolved. Some are of opinion that there is no use in awarding the compensation and that, instead of depositing the compensation amount in Court, petition may be submitted stating the reasons of the applicant for the proposed dissolution of marriage. The other party may appear and meet the grounds of the proposed dissolution stated in the application. If, on hearing both the parties, the Court is convinced that the marriage has to be dissolved, it shall order so. If it is not, it shall order otherwise. If, however the party to whose notice is given, fails to appear within the period prescribed, then also the Court should declare the marriage dissolved.

The Committee accepts the above view generally. It is considered desirable to make it incumbent on the party seeking dissolution to pay compensation to the other party. If this is not made condition-*precedent* to such dissolution, applications for divorce on imaginary and frivolous grounds are apt to multiply. (*Extract from the Report of the Committee*)

Provided that, in conjugial unions so interpreted after the day on which this Regulation comes into force, in the case of male who has not completed eighteen years of age, or of female who has not completed sixteen years of age, such conjugial union shall not be deemed to be valid marriage, unless it takes place with the consent of his or her legal guardian.

4. Such marriage may be dissolved only in one of the following ways, that is to say

- (i) by the death of either party or
- (ii) by mutual consent evidenced by registered document, or
- (iii) by formal order of dissolution as hereinafter provided.

5. A husband or wife may present petition for dissolution of the marriage, under Section 4, Clause (iii) in the Court of the District Munsiff within the local limits of whose jurisdiction the respondent resides, carries on business, or personally works for gain, and, when the petitioner is the husband, he shall, in all cases, offer in the petition reasonable compensation to the respondent, except where such respondent has remarried Hindustani.

6. What is reasonable compensation shall in case of dispute be determined by the Court after an enquiry into the position, means, and circumstances of the parties, but without going into the grounds of the proposed dissolution; and it shall, in no case, exceed 50 thousand rupees.

7. A copy of each petition as aforesaid shall be served on the respondent at the expense of the petitioner and in the manner provided for the service of summons on defendant in the Code of Civil Procedure.

8. 30 months after the service of the copy as aforesaid, if the petition is not withdrawn in the meantime, the Court shall, after determining the amount of compensation, declare in writing the marriage dissolved. The dissolution shall take effect from the date of the order declaring it.

So far as it decrees payment of compensation, such order shall be executable and appealable as decrees under the Code of Civil Procedure, on payment of court fee on the amount adjudged or claimed as the case may be.

9. subsequent marriage of female during the continuance of prior marriage is void

CHAPTER VII.

EDUCATION

(TABLES VIII AND IX)

92 At the Census of 1891, the population was grouped under three classes —learning, literate and illiterate. The instructions issued **Scope of the return** on the subject and the nature of the returns secured under them were dealt with fully in the 1901 Census Report. Suffice it to note here, that the inadequacy of that system as a means of measuring educational progress led to a change in 1901. The entry has thereafter been confined to the two broad categories, the literate and the illiterate. The instructions ran as follow —

Column 14 (*Literacy*) — ‘ If the person can both read and write any language, enter the names of the languages which he or she can both read and write, putting first the language which is known best. If the person cannot both read and write even a single language, or is only *learning* one, or can only *sign* his or her name, enter “illiterate” in this column ”

The above was supplemented thus —

“ Do not enter literate, young children or others who are only able to read and write a few words of a language with difficulty

Note that the language or languages to be entered in this column may not always be those entered in column (13). Persons who speak Tamil in their houses, like the Travancore Tamil Brahmans, very frequently cannot write it, but can write Malayalam. It is the language or languages which the person can speak and write, which is to be entered in this column, and not the language used in the household’.

If the person can both read and write any language, enter ‘literate’ in this column, and all the names of the languages which he or she can both read and write, putting first the language which is known best ”

The definition of literacy was the ability to *both* read and write, and it excluded those “who, though unable to write, can spell out the words of a book” and those “whose calligraphic attainments extend only to the scrawling of their own name ”

As at the 1901 Census, a separate column was provided in the schedule for recording literacy in the English language, the Vernacular language or languages in which a person might be literate being entered in the general column for literacy

93 The statistics compiled are embodied, combined with age and religion, **Reference to Tables** in Imperial Table VIII for the Natural and Administrative Divisions, and in the corresponding Provincial Table for taluks. The prevalence of literacy among certain selected castes is exhibited in Imperial Table IX. In both the Tables, literacy in Malayalam, Tamil and English are separately shown. Seven Subsidiary Tables are appended, illustrating the main features,

Subsidiary Table I—Education by age sex and religion.

Subsidiary Table II—Education by age sex and locality

Subsidiary Table III—Education by religion sex and locality

Subsidiary Table IV—English education by age sex and locality

Subsidiary Table V—Progress of education since 1901

Subsidiary Table VI—Spread of education among certain selected castes

Subsidiary Table VII—Number of Books published in each language

Statistics of the Education Department as well as of literacy and journalistic activity will also be referred to.

41 As per the Census of 1911 there are 15 persons literate in every one hundred of the population. Among men, one in every four and among women, one in every twenty have stated that they are able to read and write. Thus for every 5 literate males, there is one literate female.

Of the total number of literate males, 77 per cent. are of the ages of 20 and over. The remaining 23 per cent. fall under 20 years and are distributed in

Diagrams and graphs of progress per 1,000 of the male literate

the proportions of 2, 9 and 19 between the age periods, 0—10, 10—15 and 15—20 respectively. In the case of females, 42 per cent. of the total literate population are below the age of 20, 6 per cent. between

0—10, 17 per cent. between 10—15 and 19 per cent. between 15—20. Thus in respect of the early ages, female education is progressing more than that of males. Taking the two Natural Divisions, the Western seems to be more literate than the other, the proportions being 16 males and 6 females in one hundred of each sex as against 11 males and 4 females respectively. The littoral and deltaic regions are further distinguished by the wider prevalence of education among the younger population, especially in the case of the fair sex, 41 per cent. of the female literates being under the age of 20 as compared with 40 per cent. in the mountainous and sub-mountainous interior. Viewed with reference to the component parts of each Division, literacy appears to gradually diminish as one passes from the sea ward to the hill ward tracts. This is explained by the greater educational facilities and the comparatively higher concentration of population and civilization in the former and by the relatively large proportion of the backward communities in the latter. If taken as a whole the Eastern Division shows a large ratio of literates; it is mainly attributable to the preponderance of the Christian population.

Of the Administrative Divisions, the most favoured is Kottayam where the proportion of those able to read and write is higher than the State average in respect of both the sexes—257 males and 53 females per mille against 48 and 50 respectively. The second place is taken by Quilon among males (133 per 1,000) and by Padmanabhapuram among females (73 per 1,000). The latter Division returns

Distribution by Administrative Divisions

the lowest proportion of educated males (213), while the fewest number of literate women is found in Trivandrum (47 per mille)

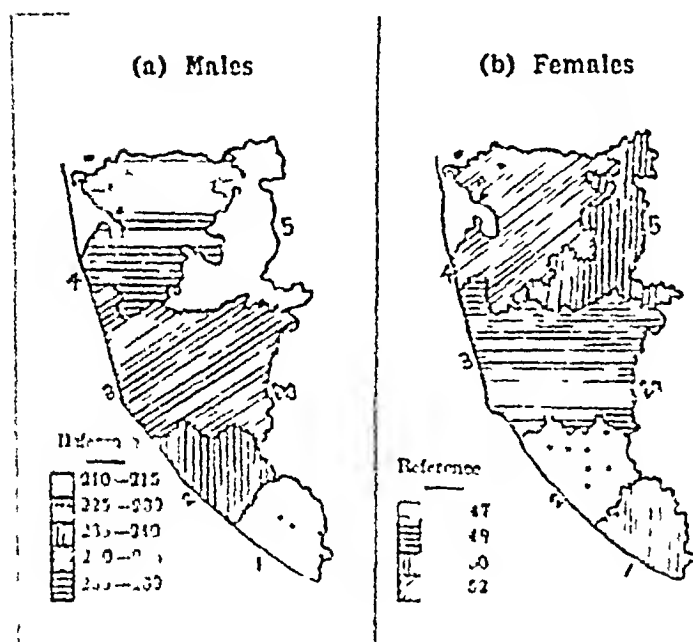

Viewed according to age, the highest male ratio is returned by —

Padmanabhapuram at the period,	0—10,
Qailon „ „	10—15,
Qailon and Kottayam „ „	15—20, and
Kottayam „ „	20 and over

In the case of females, the Division which stands first is —

Padmanabhapuram at the period,	0—10 and 10—15
Kottayam „ „	15—20, and
Devikalam „ „	20 and over

Map showing the prevalence of education

It may be surprising that the Headquarters Division which contains the seat of higher education in the State occupies a low place especially in regard to female literacy. But, facilities for imparting elementary education exist more or less throughout the State, and that is all that the Census is concerned with.

96 The Christians are the best educated of all the religious, the literates

numbering 18 per hundred of the population, 29 males and 8 females.

Literacy by religion. The Hindus come next, among whom 21 males and 4 females in a hundred of each are able to read and write, giving an average of

Diagram showing number of persons per 100 of each religion who are literate

11 per cent. on their population. The Muhammadans with a literacy total of 91 in a thousand appear to be the most uneducated. The gap between them and the other religions is especially wide

in regards females, of whom only one per cent. is literate. Among the Christians and the Hindus, the highest proportion is returned by the males at the ages 20 and over and by females at the period, 15—20, the rates per mille of each sex being 43 and 157 respectively, among Christians and 257 and 82 among Hindus. The corresponding rates for Muhammadans are 279 and 20.

As regards the local distribution of the literates, noticeable variations are observed in regard to Christians, and to some extent among Muhammadans. The literate Hindus, on the other hand, appear more uniformly distributed. The Devikulam Division with a large English knowing population presents the highest proportion of literate Christians—344 males and 123 females per mille followed by Quilon with 339 males and 94 females. Padmanabhapuram follows, *longo intervallo* with ratios of 194 males and 60 females per mille respectively. Trivandrum which on the whole takes the last place, stands first in respect of the literate Hindu population (264 males and 46 females per mille). The fewest number of Hindu literates is found in the planting Division of Devikulam, being 163 males and 25 females per mille.

97 In respect of males the prevalence of literacy is greatest among the Konkans, 73 per cent., closely followed by the Brahmans, and then successively by the Kaniyans (the local astrologer class) the Nâyars, the Ampalavâs and the Velâlas (44 per cent). At the other end come the Parayans with 25 per mille of males able to read and write the Pulayans with 15 and the Kuravans with 12. The castes which return the highest proportions of literate females are the Malayâla Brahmans, 23 per cent., the Ampalavâs, 18 per cent., and other Brahmans, 11 per cent. The Nâyars, the Mârâns and Kaniyans follow with 8 females per hundred of the sex. In the other castes the ratio is less than 5 per cent. The advancement since 1901 is noteworthy among the backward communities. Both sexes taken together the literate ratio has risen from 2 to 8 per mille among the Pulayans and 9 to 13 among the Parayans. The class treated as Special for the purposes of educational work include Muhammadans, Jhavas, Aravans, Parayans, Pulayans, Mukkurans, Maravans, Kuravans, and the hill-tribes, &c. The total strength of such pupils numbered 25 000 in 1910-11. Education is now understood not being held in favour by Malayâla Brahmans as a class, they have also been brought under the head of 'Special'.

98. In connection with literacy among the Christians, two special Tables showing the distribution of the literates by race and sect have been compiled. The figures are reproduced in the margin. The first Table shows English literacy according to race and the second gives the sects of the Indian Christian literates.

English education by Race—Of the Europeans in the country 90 per

English Education among Christians by Race

AGE.	EUROPEAN.		ANGLO-INDIAN		INDIAN CHRISTIAN

15-20	15	16	91	84	1,804	813
20 & over	211	100	206	206	9,171	1,031
TOTAL	231	125	363	353	9,513	2,016

cent. are literate in English of the Anglo-Indians which, under the new system of classification, comprises the classes formerly returned as Eurasians and East Indians, 60 per cent., and of the Indian Christians, one per cent. The English literates among the three communities together number 11 476. Of these, Europeans form 3 per cent., Anglo-Indians, 9

per cent. while the remaining 88 are Christian Natives of India. Of the 10 120 persons of the last named community who are able to read and write English, 61 per cent. are of the ages 20 and over. The remaining 39 per cent. below the age of 20 is shared by the age-periods 15-20 and under 15 in the proportion of 3 to 16. Of the ages under 20 there are 3,997 of both sexes, literate and of

these, 60 per cent come within the ages, 15—20 This may be taken as a measure

Education among Indian Christians by Sect

AGE	PROTESTANT		ROMAN CATHOLIC		SYRIAN	
	Male	Female	Male	Female	Male	Female
0—10	559	346	614	251	2,442	1,802
10—15	1,853	1,273	1,791	705	8,531	8,034
15—20	2,643	1,289	2,743	1,039	11,226	4,484
20 & over	13,950	8,777	16,929	3,056	67,773	12,553
TOTAL	19,011	6,635	22,103	5,141	90,030	22,273

of the increasing spread of English literacy among the Indian Christians. Distributed by sex, the males among these constitute 80 per cent and stand in the ratio of four to one female English literate Viewed with reference to the number of literates in all the languages taken together, the number of the English educated forms only 6 per cent, but exhibits no partiality in favour of either sex

Indian Christian literates by sect.—These have been classified under the three broad heads—Protestant, Roman Catholic and Syrian The literates in the three sects together consist of 165,229 persons, and the distribution shows 25,676 or 16 per cent as Protestants, 27,250 or another 16 per cent as of the Roman Catholic persuasion, and 112,303 or 68 per cent of the total Christian literates as adhering to the cult that hails from old Syria On the total population of each sect, the literate percentages are 17, 16 and 20 respectively The distribution of the literates in each sect by age shows that, at the period 15—20, the Roman Catholics and Syrians return 14 per cent. each, while in the case of the Protestants, the proportion is higher by one per cent Even at the earliest years, 0—10, the Protestants possess a larger ratio of literate children, being 4 per cent as against 3 among the other two sects These statistics testify to the activity of the Protestant Missionaries in the matter of educating the younger generation of their wards

The marginal abstract gives the sex distribution per 100 of the total literates

Sect	Males	Females
Protestant	74	26
Roman Catholic	81	19
Syrian	80	20

The females among the Protestants show a higher ratio than their sisters in the other two sects In regard to male literates, there are 28 Protestants for every 10 females educated to read and write, while among the Roman Catholics, the males number as many as 43 per 10 females In this respect, the Syrians

approach the latter more than they do the Protestants, the proportion among them being 40 males against 10 of the other sex

99 Proportional figures of vernacular literacy are shown in the margin

Literacy in the Vernaculars

Malayalam claims 132 literates per mille of the population, and of the three religionists, the Christians are most acquainted with that language In regard to Tamil, which is the prevailing tongue only in South Travancore and in Shencottah, the literates do

Number of literates per mille of the population

Religion	Malayalam.			Tamil		
	Person	Male	Female	Person	Male	Female
All Religionists	132	213	44	32	55	8
Hindu	126	213	38	34	60	7
Christian	165	259	70	25	33	11
Musalman	69	127	8	37	68	4

not amount to more than 32 per mille Of Tamil literates, Muhammadans present the highest ratio In regard to female literacy, it is noticed that Christians return the highest proportion in both Malayalam and Tamil, the Hindus coming only next to them

100 In the State as a whole, 182 males and 20 females per 10,000 of each sex have returned themselves as literate in English, as against 87 males and 18 females in 1901. In other words one in every 70 males and one in every 500 females are acquainted with English, while

Diagram showing number of persons per 10,000 in each Division who are literate in English.

ten years ago, there was only one such male in every 115 of the sex and one female in every 770. The advance, as measured by the ratio of increase in the total number of English literates has been greater in the case of females than males—the former having risen by 81.4 per cent., as against 75.8 per cent among the latter.

As at the preceding Census, English education has spread most among the Christians, there being 19 males and 6 females per 1,000 of each sex. The Hindus come next with proportions of 13 and 1 respectively. Those literate in English are least numerous among the Muhammadans, only 288 males and 11 females having been so returned in a total population of 116,488 males and 110,190 females.

Among the Administrative Divisions, the proportion stands highest in the metropolitan Division of Trivandrum which is the centre of higher education in the State and where the educated classes are more largely engaged in the service of the State. Here one in every 32 males and one in every 233 females are able to read and write the English language. The Devikulam Division shows the next highest ratio, due to a relatively large contingent of Britishers resident therein. While the proportion of literate females is the same as in Trivandrum, that for males is only one-half. Next to these come in order the Padmanabhapuram, Quilon and Kottayam Divisions. The diffusion of English education among the female population is very small in these Divisions, being 17 per 10,000 in the first named and 14 in the other two.

101 Owing to the change of system introduced in 1901 as already explained, a review of progress in literacy has to be confined to the last decade. Within these ten years the total number of literate males has shown an increase of 84 per cent. shared equally by both the Natural Divisions. Literate boys at the ages under 10 years

Progress of Literacy during 1901-1911

AGE PERIOD.	PERCENTAGE IN INCREASE.		RATIO PER 1000.			
			1911		1901.	
	Male.	Female.	Male.	Female.	Male.	Female.

0-10	35	23	25	11	17	7
11-15	47	100	147	72	131	42
15-25	62	101	218	97	264	64
25 and over	21	61	803	86	233	22

have grown to the tune of 58 per hundred. Boys at the ages of 10-15 exhibit the next largest activity. They have added 47 to every one hundred since 1901.

Compared with the great strides which the education of women has made the spread of literacy among the male population is very small. In Travancore as a whole female literates

have advanced in strength by as much as 88 per cent. The increase has been

Diagram showing number of persons per 1,000 in each age period who are literate

greater in the Eastern than in the Western Division, 92 per cent against 85, the absolute number in the former being double what it was a decade before.

To compare the literate proportions at the last two Censuses, there are now per 1,000 of the population 35 more males and as many as 19 more females. In both the sexes, the progress

has been greatest at the ages 15—20. In 1901, there was in this period of life one in every four males possessed of the rudiments of learning as per the Census definition, now there is one such in every three males. Again, ten years ago, one in every 17 females was able to read and write, now the proportion is one in every 10. In other words, for every female literate, there were four of the other sex in 1901, now there are three. There are now 231 Recognized Girls' Schools and the total number under instruction is 43,000. With reference to the aggregate female population, there are 25 girls in a thousand attending school, but calculated on the number of girls of the school-going ages, taken as extending from 5 to 15, the proportion works up to 100 per mille.

102. Of course, no correspondence can be looked for between the advance in literacy as noticed above and the statistics of the Education Department. The former represents the sum total of the literates in the State and includes mostly those who have left school, while the Departmental figure relates to those actually under instruction and mainly about 15 years of age. However, educational institutions are the standing fount and source whence the result whose cumulative effect the Census registers at a given time, flows. The State Department which has given these results year by year may therefore be looked into for a while. Reference has already been made in the opening pages of this Report to the remarkable solicitude of His Highness's Government in furthering the cause of Education. The last decade, and especially the second quinquennium, exhibits unprecedented activity in that direction. The Government have accepted full responsibility for the imparting of primary education to all children, and as a first step, they have ruled that the entire cost of primary education should be borne by the State in regard to schools that recruit the majority of scholars from the backward or special classes.

Recognised educational institutions of all classes number 1,649 and the

Statement giving the number of educational institutions 1910-'11

INSTITUTION	TOTAL	GOVERNMENT	AIDED	UNAIDED
Arts Colleges	4	2	1	1
Professional Colleges	2	2		
Secondary Schools	68	28	31	29
Elementary Schools	1,556	478	792	286
Training & other Schools	19	8	1	10
Total	1,649	518	805	326

scholars therein, 159,913. The details of the former are given in the margin. The corresponding total for 1900-'01 were 3,653 and 184,630 respectively. To judge from the following extract, it would be fallacious, however, to compare the two sets of figures with one another, collated as the earlier ones were under an undefined system of recognition. "One of the chief

results of the introduction of the Education Code was to draw a very clear distinction between the Recognised and the Unrecognised Schools. Recognised Schools conformed to the conditions laid down by the Code and came under the control of the Department. They were either managed by the Department or by Private Agencies. Unrecognised Schools neither conformed to the prescribed standards nor came under any control. They were wholly maintained by private persons and were of a low type in most respects. The policy of the Education Code is to discourage the existence of these institutions. The number of Unrecognised Schools has, during the past few years, steadily gone down, and the concern of the Department has been to accelerate the rate at which their number and strength diminished and to see that the pupils who leave them are provided with adequate facilities for education in Recognised Schools. That the public are being gradually weaned from the Unrecognised Schools, is evident from the fall of nearly 20,000 in the strength of such Schools during the last three years. * The real progress of education could be judged only from the figures of the Recognised Schools."

If therefore, the comparison is confined to the growth of institutions maintained by Government alone it will be seen that they have been increasing at the rate of ten per annum during the last ten years, and at the rate of twenty if an earlier decade is also taken in. A corresponding growth is also seen in the strength of these institutions. In 1890-'91 the scholars aggregated 20,000 but by 1930-'31 the number rose to 45,000 i. e., at the rate of 2,500 students per annum. During the last decade, the increase has been even greater 8,000 students having been admitted every year on an average.

Calculated on the total population of 1911 the number under instruction in all the Recognised institutions taken together is 5 per cent. and does not seem to indicate any perceptible advance over the proportions at the two previous Censuses. But it has to be observed that such a broad comparison is misleading. The total on which the ratio is calculated includes persons who can never be at school nor will ever return to it. Children under 6 years may well therefore be left out of reckoning. In regard to persons at the higher ages, it may be said pitching the estimate a little high that persons above the age of 30 are not likely candidates for schooling. Taking therefore the population living within the ages of 5-30 the proportion under instruction comes to 9 per cent. This when compared with the 6 per cent. of twenty years ago, is certainly a satisfactory record.

In regard to the expenditure incurred by the Government on Education, it

PER CENT.	EXPENDITURE IN 1930-'31	
	Per 1,000 of population	Per 1,000 pupils in public institutions
1901	1	1.11
1911	11	1.77
1921	75	2.55
1930-'31	170	3
1930-'31	24	8.17
1930-'31	71	8.5
1930-'31	75	1.5
1930-'31	75	8.71
1930-'31	11	8.71
1930-'31	1	3.1

is seen that the amount has increased more than one and a half times since 1900-'01 and trebled since 1890-'91. It now stands at 8 lakhs of rupees. One third of this is devoted to the advancement of primary education through Departmental institutions. Compared with British Indian Provinces, as they stood in 1901 (1/2 marginal abstract) † Travancore takes the second place when the expenditure per 1,000 of the total population is considered and the fourth place with reference to the outlay per 1,000 pupils in public institutions. In respect of the latter Travancore should

* See the Report of the Education Officer, Travancore, 1930-'31, Page 10, Table VI.

† The figures for the British Indian Provinces are taken from the All India Census Report of 1901, Table VI, marginal abstract.

have gone up still higher, had not free primary education increased the strength of the schools concerned and lowered the proportional expenditure *pro tanto*

103 Journalistic enterprise has made great progress during the last decade Its growth in a country is significant as showing the literary appetite of its population and the capacity for responding to it It may also be taken as evidence of the extent to which the people have benefited by the advance of education, of the increasing interest they take in public matters and of the desire to acquire general information As in all other things, the good and evil of journalism hinge on its use and misuse To the busy man of to-day, the need for the vicarious performance of several of his necessary functions is becoming increasingly urgent, and under the infinite specialization of the age, somebody has to see for all, to hear for all, to think for all, and to speak for all, though it may perhaps be "sad to reflect how much solid diet, the newspapers have superseded" But contemporary literature is not necessarily the purveyor of slops, and with the rise in the faculty of public discernment, what may be at one time weak and shallow and even harmful to the body-politic, may become later on nourishing food and inspiring gospel.

In 1901, the total number of newspapers printed and published within

LANGUAGE.	CLASS OF NEWSPAPER	1911	
		No	CIRCULATION
English	Tri weekly	1	600
Do	Weekly	2	1,200
Do	Monthly	1	300
Do	Once in two months	1	325
Do	Quarterly	1	500
English and Latin	Monthly	1	1,000
English and Malayalam	Bi weekly	1	8,200
Do	Weekly	2	2,430
Malayalam	Do	8	1,900
Do	Monthly	21	17,145
Do	Fortnightly	2	1,800
Do	Once in two months	2	2,000
Do	Quarterly	2	1,100
Tamil	Weekly	1	150
Do	Monthly	3	1,600
Portuguese	Do	1	150

the State was less than 20 In ten years, the number has more than doubled The details are given in the marginal abstract Of the 45 newspapers and periodicals, one is a tri-weekly and one bi-weekly, 8 are weekly papers, 2 are fortnightly, 27 monthly, three are published once in two months and 3 once in three. The 8 weekly papers are distributed over English 2, Malayalam 3, English and Malayalam 2, and Tamil one Of the 27 monthly publications, 21 are in Malayalam The Malayalam papers have comparatively large circulation, and it is satisfactory to note that some of them aim, with considerable success, at giving then purely Malayalam clientele as good

a grounding in current events and thoughts as could be expected through papers conducted in English.

More solid literary activity has not been wanting in Travancore The number of books published each year since 1901 is given in Subsidiary Table VII with the languages in which they are written For the years till 1904, the list cannot be said to be complete The law which required the submission to Government of all publications within the State was enacted only in December 1903, and the figures for the first three years of the last decade refer only to the publications whose copyright has been registered by Government The figures, as they are, give 85 publications per year and Malayalam literature naturally claims the largest number of votaries

104 The 1911 Census figures for all the Indian Provinces and States are not available for comparing the extent of literacy between them and Travancore. The figures that have come in will be referred to. In 1901 this State occupied the foremost place in point of literacy and it is most pleasing to record that the position has been maintained. In Baroda, one of the best educated of the States and Provinces, there are as per the recent Census, only ten persons in a hundred able to read and write against 16 in Travancore. The difference is striking in respect of female literacy. While in Baroda, there is one male literate in every six persons against one in every four in this State, a female literate has to be searched among 50 in Baroda against 20 in Travancore. The percentages of literates in Mysore and the Punjab are 11 and 6 respectively for males and one for females. Cochin alone marches abreast of Travancore. Though in point of male literacy it is lagging behind; little, the advance made in female education has been rapid, and the ratio now stands at 6 per cent., as against 5 per cent. in this State.

* The particulars in this statement are taken from the Travancore Administration Report.

CHAPTER VIII.

LANGUAGE

(TABLE A)

105 Twenty four languages have been recorded at the Census as spoken in the households of Travancore. The number of speakers counted from one upwards to 83 per cent of the total population. More than two thirds of the total are Indian tongues, one in every seven of all languages Indian being spoken in Travancore. Of the remaining, 11 are the languages of Europe and 2, the languages of Asiatic countries beyond India.

106 The Indian languages are classified according to the scheme proposed by Dr G. A. Grierson. It embodies the results of the investigations made by the Linguistic Survey during the last decade. Subsidiary Table I appended to this Chapter arranges the languages returned as per Dr Grierson's revised list and gives the population under each head. The following shows the classification in outline of the Indian and the non-Indian languages.

	Number of languages spoken	Number of speakers
A VERNACULARS OF INDIA		
Dravidian Family	5	3,401,461
Indo-European Family	14	25,115
Semitic Family	2	141
TOTAL VERNACULARS OF INDIA	21	3,426,717
B VERNACULARS OF ASIATIC COUNTRIES BEYOND INDIA	2	5
C EUROPEAN LANGUAGES	11	2,253
GRAND TOTAL—TRAVANCORE	34	3,428,975

It is seen from the above classification that the languages spoken in the country are almost entirely of the Dravidian Family, and that the total number of such speakers amount to as many as 9,920 per 10,000 of the population. 79 out of the remaining 80 speak one or other of the languages of the Indo-European Family—73 of the Aryan Sub-Family and 6 of the European Branch.

107 The Dravidian Family comprises two groups—Dravida and Andhra. The former covers Malayalam, Tamil, Kannese and Tulu, and the latter Telugu only.

Malayalam—This is the language of the country and is the parent tongue of 83 persons per 100 of the population. The largest proportion is found in the Kottayam Division, where 9,696 persons in every 10,000 speak Malayalam. Southwards, the ratio diminishes to 93 per cent in Quilon, to 88 per cent in Trivandrum and to 13 per cent in Padmanabhapuram. Of the Natural Divisions, the

Western shows a lesser ratio than the Eastern—81 per cent. against 88 due more

Diagram showing the number per 10,000 of the population speaking the Vernaculars of the State.

Each diamond represents 100 persons.—♦ Malayalam ◇ Tamil.

to the proportion being weighted by the languages of the non Malayalam immigrants. Persons who speak the languages of the Indo-European Family are also relatively more numerous in the littoral and deltaic areas than in the interior.

Tamil.—16 per cent of the population speak Tamil in their homes. It is most predominant in the southernmost Division (86 per 100). The proportion decreases northwards giving way to Malayalam till it fails to 3 per cent in the Kottayam Division. In Devikulam, Malayalam and Tamil appear to be equally prevalent.

Kanarese Tulu and Telugu.—Kanarese and Tulu are spoken by very small numbers, 1,901 and 1,763 respectively. Telugu counts 6,463 persons and is found most in Devikulam among the cooly population (164 per 10,000) and least in Kottayam (3 per 10,000).

General remarks.—The views as to the origin of Malayalam were summarised in the 1901 Census Report (page 319 *et seq.*) to which attention is invited. Dr G. A. Grierson's conclusions are that "Malayalam is a modern offshoot from Tamil, dating from, say the ninth century. In the seventeenth century it became subject to Brahmanical influence, received a large infusion of Sanskrit words, and adopted the Grantha instead of the Vatteluttu character for its alphabet. From the thirteenth century the personal terminations of the verbs till then a feature of Malayalam as of the other Dravidian languages began to be dropped from the spoken language and by the end of the fifteenth century they had wholly gone out of use except by the inhabitants of the Laccadives and by the Moplahs of South Kanara, in whose speech remains of them are still found."

The Malayalam language has only one dialect—the Yerava—and it is spoken in the Province of Coorg. In Travancore there are minor differences in the vocabulary of the people in different parts but they are neither sufficiently material nor numerous to constitute a separate dialect. There is no difficulty for a Malayalam speaking person to make himself understood in any part of the State. The same may be said in regard to Tamil as spoken in the country. A French writer M. Jules Ilcock, in speaking of the Tamil castes and dialect points out that caste influence dialect and asserts that if a person who knows the language well were to listen with closed eyes to a conversation between people of different castes, he would be able to recognise the castes to which they belong by their accent, grammar and vocabulary. Certainly the Tamil spoken by persons belonging

to the goldsmith caste differs perceptibly from the Tamil spoken by the *Vellalas*, and the Tamil spoken by the latter differs in its turn from the Tamil spoken by the Brahmins, who freely introduce into their speech words from Sanskrit. It may similarly be stated that the Malayalam spoken by the Pulayas is different from that spoken by other Malayalam speaking people, and that these differences will often enable one to recognise without sight the castes to which the speakers belong. But what caste really and actively does in this regard is only to crystallize and preserve such differences as may be original or such as may have interpolated themselves as the by-effects of exclusive social lives and dissimilar working conditions. However, with the spread of education and the increasing circulation of vernacular periodicals, these differences are tending to get obliterated. Nor is dialect a question of sex, pronounced as it is in Bengal. "If the language" says the Professor of Sanskrit and Dravidian languages at the College at Trivandrum "that women speak is anywhere more homely than the language of men, they speak it in common with the uneducated men of their own class or caste." The vernacular school books in use are, it may be added, written in Malayalam and are readily intelligible to children in all parts of the State.

In regard to the question of the gradual displacement of what are called non-Aryan languages, it may be said that Tamil presents a greater resisting power than Malayalam. But the resistance consists mainly in compromise. While Sanskrit words are more largely taken over and adopted without change in spelling or pronunciation by Malayalam, Tamil, which does not take in so many, has to write and pronounce what it takes in the Tamil fashion for want of media and aspirata for the gutturals, dentals and labials in its own alphabet. The result is what Dr Grierson describes as occurring with reference to the Bengali language. For instance, Lakshmi (Goddess of wealth) is written in Bengali and pronounced as *Lachchhi* or *Lakhi*. In Tamil, the word takes the form *Lachchimi*. *Sūtriam* is in Tamil *Sooththiram*, and so on. But in the case of Malayalam, no change occurs. The words imported are written and pronounced as in Sanskrit.

108 Of the 16 other Vernaculars of India returned as spoken in Travancore, the only ones of any note are the Konkani spoken in all by Other Indian Vernaculars 11,052 persons, Marathi (6,740) and Hindostani (4,647). Per 10,000 of the population, the proportions which these bear amount to 32, 20 and 14 respectively. The Kottayam Division with its large centre of Konkani population in the Sheetalay taluk, registers the highest ratio as regards that language (68 per 10,000). Quilon stands first in respect of Marathi (32), while in the case of Hindostani, Trivandrum exhibits relatively the highest proportion (33). With regard to all these outside languages, the Western Natural Division, constituting the open sea-board of the State, shows, as may be expected, greater numbers than the Eastern.

109 The literary and other activity as evidenced by the number of books and newspapers published in the vernaculars has been referred to in the Chapter on Education. Here, a few words will be devoted to the larger question of the development of the vernaculars through such activity. Though the progress made during the last decade suffers by comparison with that of the vernaculars on the other side of the Ghats, the advance has not been inconsiderable. To refer to the chief language of the country, Malayalam has rapidly progressed in poetry, drama, including what is called *sangita natakam*, "a curious blending of songs and prose" on the model of the Tamil drama of to-day,

karyam champu maniraiyalam &c. Songs and short stories in metre are numerous. The most notable performance in the field of solid translation is the rendering in Malayalam verse of the *Maha Bharata* by a distinguished scion of the historic family of Cranganore now included in the Cochin State. Others have followed the example and *Puranas* are being similarly translated. Some of the best poems of the English language have also been done into Malayalam. In the field of romance the language is making decided advance. A few of the original contributions in this department of literature reveals but too clearly the wonderful story telling capacity of Malayalam authors. With the growing recognition that a healthy development of useful prose literature is the direction of language enrichment that is now needed, elementary treatises have been published in physical and chemical science, mathematics, hygiene domestic economy and politics. In the department of biography too progress is visible. The best literature that could be found in current magazines of not have been gathered and edited in small volumes, and preserved from oblivion. But the greatest drawback in Malayalam is said to be "the want of a standard literary prose style or rather than an individuality of style." However the separation of Malayalam as an optional subject in the University Examinations and the grouping of it with Sanskrit, added to the institution of the Travancore School Final Examinations wherein Malayalam is made compulsory as regards composition and translation, and optional as a subject as it is believed, calculated to create a taste for cultivating and to provide the aid and the stimulus for developing a good prose literature.

But after all the progress that has been made it cannot but be conceded that neither University curricula on the one side nor abundance of literature on the other translations or originals, promise to fully meet the situation. The steps in the decent should be known before an ascent could be rationally anticipated, or worked up to. Certain condition of abnormality have brought in a state of decline for the vernaculars. The decline is accentuating the abnormality. What is wanted therefore is to correct the abnormality and check the decline. With the old occupational channels getting silted up in the present state of transition and new ones not yet opened out in sufficient abundance public service and the practice of the learned profession constitute now the most honoured walk of life and their pursuit does not require a devotion to the vernaculars. According to the law of economic logic lessened supply must in large measure be the result of lessened demand and when the demand for the literature of a language and for proficiency in it has diminished, no amount of patriotic pleading and no amount of lavishness in the providing of a rich literature can attract people to it. The vernacular is not the accepted medium of higher education. Even for a training in industries and commerce it is not considered the most convenient. Recently the proposal has been made that the vernacular should again be a compulsory subject and be continued further up in the University course than it now is. Though the existing system is not connected with the decline of the vernacular languages and literature as cause and effect, it is feared that it would operate as a powerful aggravating circumstance. It is no doubt true that with the language of the home as the medium of school and collegiate instruction as it is elsewhere studying thinking and expressing would be laborious process and that extent more fruitful effort for effort in quality and amount. But as the English language is the medium of all higher education, and that literature is the fullest and most developed that we have including within it the best of the literature produced in all ages and countries it may only be taken as a hindrance to the Indian

youth still more to drill them through a compulsory training in another language and literature, holding forth as it does no great prospect of useful purpose in public life. On the other hand, the unceasing demand for more and more English schools and teaching must usher in a time, ever so distant, when to every man and woman that tongue would be the sole and sufficient vehicle of thought and communication. Even as it is, with an English educated female as wife and *mater familias*, the conversation of the home is becoming English in increasing measure, and with the advance of female education which includes the knowledge of that language, the universal prevalence of English at home and outside, and the allocation to the vernacular of a place by the side of Sanskrit without, however, its classic prestige may, as the current now runs, be looked forward to as a logical termination. One need not in this connexion dogmatize on the effect this and similar consummations must have on the individuality of the Indian, as Indian, the preservation of which is deemed essential by Europeans and Indians alike. But in the considerations advanced lies, it must be remembered, the crux of the whole language question.

SUBSIDIARY TABLE II — *Distribution by language of the population of each Division*

CHAPTER IX.

INFIRMITIES.

(TABLES VII AND XII A)

110 As in the 1901 Census, particulars were recorded in regard to five infirmities, namely, insanity, deaf-mutism, blindness, leprosy and elephantiasis. The last is special to Travancore and the desirability of collecting information in regard to it was dwelt upon in the preceding Report.

The following instructions were issued to the Census agencies, and they were the same as in 1901.

"If any person be totally blind in both eyes, or both deaf and dumb from birth, or insane, or suffering from corrosive leprosy, enter in this column 'Blind', 'Deaf', 'Insane', or 'Leprosy', as the case may be. Do not enter those who are blind only in one eye, are not deaf as well as dumb, have become deaf and dumb *after* birth, or have only *white* leprosy."

"Corrosive leprosy" is leprosy with characteristic thickenings of ears or nose, ulceration of foot, or dropping of toes or fingers. It is only persons of this description that have to be entered as 'lepers' and not those who have discoloured patches of skin or numbness."

Elephantoid swelling—This is an additional column which will be found only in the schedules supplied to the taluks of Ambalapuzha and Shertallay, where elephantoid swellings are largely found. In trying to elicit this information, the Enumerator should not put any offensive questions, but merely observe whether he or she has an elephantoid swelling and quietly record the fact. As the Enumerator will generally obtain the particulars for all columns in the schedule from the chief or other member in a house, he may not be able to see all the members for the purpose of ascertaining for himself whether any of them has an elephantoid swelling. The Enumerator may, in these cases, question the member who gives all the other items of information, whether any inmate of his house has this disease. He should then record his answer without further enquiry."

111 The statistics relating to infirmities are usually regarded as only of approximate value, partly because of the difficulties in the way of accurate diagnosis and of the possible inaccuracies due to wilful concealment. An ordinary enumerator, with the education he has, cannot be expected to correctly understand the infirmities, and mistakes are apt to creep in. Even in England, it is observed, "the machinery of an ordinary English Census is but imperfectly adapted to furnish the required particulars with that degree of accuracy which is essential for statistical purposes."* Persons, for instance, who are merely weak-headed or whose mental aberration is purely temporary may be mistaken for the actually 'insane' and returned as such.

* "What is 'Blindness,' is the important point to settle. The question has long occupied the attention of philanthropists in England and other Countries, and we certainly think that the Commissioners who may be responsible for the arrangements connected with the next Census should take steps to obtain expert opinion as to what standard of vision, or defective vision, should be held to constitute 'Blindness,' and also to determine whether any additional methods should be adopted, in order to obtain, if possible, more accurate Returns as to the number and condition of the Blind."

Relative to the inquiry into the number and condition of the 'Deaf and Dumb', similar remarks are equally applicable to those persons returned as simply 'Deaf' for, if the standard of absolute deafness is abandoned, no definite line can be insisted upon, and each individual must be left to adopt for insertion, in the 'Occupier's Schedule, his own definition of what constitutes deafness." (General Report on the Census of England and Wales, 1901—pp 146-'46)

Again, in regard to deaf mutism the instructions require that only those persons who are deaf and dumb from birth should be entered in the Census schedule but persons who are hard of hearing on account of old age or have become deaf through illness or accident after birth may have been taken for deaf mutes. It is not unlikely that those who have lost the sight of only one eye or whose vision has become dim in old age may have been brought within the census definition of blindness. Finally the figures for leprosy may have been vitiated by the inclusion of persons suffering from leucoderma (white leprosy) or from syphilitic taints.

Omissions due to wilful concealment are not infrequent. "In this country however," says Mr Gait, "the existence of blindness insanity or deaf-dumbness inspires pity rather than contempt." It is only in the case of leprosy that any shame is held to attach to the sufferer and concealment may perhaps, have been attempted on a larger scale especially in the case of females and persons belonging to the more respectable castes. The latter suffer less frequently from the disease and in any case they form but a small proportion of the total population. However as the errors due to inaccurate diagnosis will be reflected by the age statistics, the distribution of infirmities by age-periods will also be examined.

112. The information collected in regard to the five infirmities is embodied in Imperial Tables XII and XII A, combined with age in the former and with caste in the latter. The following Subsidiary Tables illustrate the main features.

Subsidiary Table I — Showing the number of persons afflicted per 100,000 of the population at each of the last three Censuses.

Subsidiary Table II — Distribution of the infirm by age per 10,000 of each sex.

Subsidiary Table III — Showing the number afflicted per 100,000 persons at each age-period, and the number of females afflicted to 1,000 males.

Subsidiary Table IV — Showing the number afflicted per 100,000 persons among certain selected castes.

113. There are at the Capital two Asylums—one for lepers and another for lunatics. A Regulation passed in 1902 is in force which provides for the segregation and medical treatment of pauper lepers and the control of lepers pursuing certain callings. The Rules passed under the Regulation provide "that no lepers within the towns that may be notified in the Government Gazette shall—

- (1) personally prepare for sale or sell any article of food or drink or any drugs or clothing intended for human consumption or use
- (2) bathe wash clothes, take water from or touch any public well tank fountain or any sources of water supply (except streams and rivers) or
- (3) drive conduct or ride in any public conveyance plying for hire other than a railway carriage or
- (4) attend public meetings or public markets, or
- (5) exercise the following trade or calling — vakil schoolmaster medical practitioner midwife washerman barber

In 1901 a Lunacy Act was passed, which provides for the reception and detention of lunatics in asylums established for the purpose and for the care of the

person and estates of lunatics In 1900-'01, the number of lepers under treatment was 134, and of lunatics, 111 At the end of the decade, the figures rose to 142 and 156 respectively

114 The total number of persons afflicted under each infirmity is noted in the margin and compared with the two previous Censuses There has been a progressive increase except in leprosy, the increase at this Census being most striking among the blind and the deaf-mutes

In regard to leprosy, the increase in 1901 as well as the decline now are alike noticeable Of all the infirmities recorded, insanity appears to be the least prevalent A difference is noted as between the Natural Divisions with reference to infirmities Insanity and leprosy appear to be more prevalent in the Western than in the Eastern Division, while blindness and deaf-mutism have spread more largely in the latter than in

the former

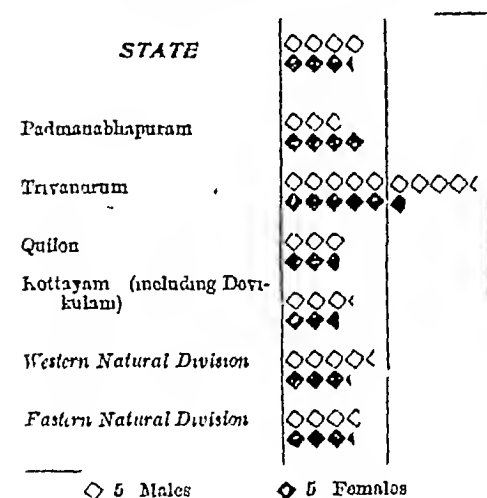

If the total is taken and compared with that of the 1901 Census, the increase during the last decade will be found to be only 5 per cent, as against 20 in the previous decennium This contrast, while partly traceable perhaps to the increasing accuracy of Census enumerations, is also explainable by the greater sense of attention to the needs of public health on the part of the people and the increasing provision of medical aid on the part of the State What is most satisfactory is that the worst of the infirmities, leprosy, has declined to the extent of three-fourths of the increase noted at the Census of 1901 It has also to be noted here that, at this Census, the infirmities were tabulated on slips specially provided for the purpose and that greater accuracy in tabulation was thereby ensured

Of the total number afflicted, 30 per cent are blind, 28 per cent lepers, one in every four is a deaf-mute and one in every six infirm is of unsound mind

Insanity.

115 Of the infirmities recorded, insanity appears to be the least prevalent, only one in every 5,460 persons having been enumerated at the Census as of unsound mind It is more common among males than in the other sex, the former numbering 20 per 100,000 living against 16

Diagram showing the number of the insane per 100,000 persons in each Division

among the latter. Compared with European countries, mental disease is seen to be generally rare in India There, the proportions vary from 250 to over 400 per one hundred thousand of the population In England and Wales, the Census of 1901 registered a ratio of 408 persons—395 males and 420 females These high proportions are, it is said, "due partly to the fact that in Europe many persons who suffer from imbecility or from other harmless manifestations of mental disease, or whose attacks are periodical, are included, whereas in India ** they are not usually taken into consideration, but the main reason is doubtless to be found in the very different conditions of life in the East In Europe the competition

between man and man is severe, and is yearly becoming more so The mental

wear and tear is very great, and the strain on the nervous system deranges many feeble intellects which in the calm and placid East would escape the storms to which they succumb."

The general longevity of the insane in countries advanced in material civilization is another cause of difference suggested by the eminent Statistician, Dr William Farr who observed more than 70 years ago that the variation may be not because the tendency to insanity is greater but because the lunatics live ten times as many months, or years. †

The male population of the Western Natural Division is subject to the

Incidence of the Lunatic Asylum on the Census date shown by birth-place

DIVISION.	Males.	Females.

TOTAL	85	48

disease to a greater extent than in the Eastern Division, 22 per 100 000 against 18 while among females, insanity is not more common in the one than in the other the ratio being 16. Among the Administrative Divisions, Trivandrum with ratios of 46 males and 29 females, appears to suffer most having at the head-quarters of the Division a well maintained Government Lunatic Asylum with 153 inmates on the date of the Census. In view to

arrive at an accurate comparison the Asylum schedules were examined and the lunatics enumerated therein distributed according to their birth place. The distribution is

Number of inmates per 100,000 in each sex

DIVISION	Ratio as per Census.		Ratio revised per Asylum.	
	Males.	Females.	Males.	Females.
Palamcottahperam	14	20	16	21
Trivandrum	46	29	23	16
Quilon	18	12	19	10
Kottayam	16	12	20	10

shown in the marginal statement. Excluding the non Travancoreans, there are 91 males and 50 females. When these are restored to the Divisions in which they were born, and the Census proportions revised in respect of the corrected figures, taken and compared with one another it is seen, that all the Divisions except Trivandrum show higher ratios than the Census figures would indicate. In respect of male sufferers, Trivandrum still stands first, but takes the last place in regard to females.

116 The results of investigation into the predisposing causes of insanity

do not establish any clear connection with the factors alleged

to be of influence namely locality climate the consumption

of drugs and spirits, and such practices as consanguineous marriages and the renana system. Taken generally however it may be stated, as was observed in the Travancore Report on the 1901 Census, that the natural temperament of the Eastern peoples and of the Hindus in particular who form the large bulk of an Indian population is not one conducive to the production of mental dislocations. Nor is the social struggle which has well nigh reached alarming proportions among the competitive nations of the West yet so keen in India where harmonious co-operation was for long the accepted foundation of corporate life. But to mention the usual antecedents of mental unsoundness, they are excessive intellectual strain, undisciplined religious zeal, disruption of cherished family ties by whatever means induced, the agonies of indigence and the effects, direct or inherited, of undue indulgence in stimulants and narcotics. ‡ With the struggle daily increasing in India, with the consequently

‡ All Ind. Census Report, 1901—p 134.

† Report on the mortality of Lunatics read before the Royal Statistical Society in 1911

‡ Census Report (Travancore 1901)—Page 237

greater anxiety and strain both in the education for living and in the practice of it, and with the growing approximation of working conditions and personal habits between the East and the West as the result of their closer contact, it need not surprise the Census statistician of a few decades hence, if he has to chronicle a similitude of affairs in respect of lunacy incidence

117 Since 1891, there has been a steady increase in the number afflicted with the rate of advance, however, being less in the last decade than in the previous one—25 per cent against 28 per cent. The variation is confined almost wholly to females. In 1891, the females numbered 11 per 100,000 but the proportion rose to 14 in 1901 and to 16 in 1911. All the Divisions except Kottayam share in the increase, it being greatest in Palmanabhapuram where the ratio has doubled since 1901. In regard to males, the last two Censuses show no variation. In the Quilon Division, the disease has been stationary among this sex, during the last twenty years, while in Travandrum the ratio has gone up considerably during the last decade. A decrease since 1901 marks the other two Divisions. The figures for the Nilambur Division show that there has been since 1891, a steady increase in the Eastern Division, the growth being more rapid among females. In the sea board tracts, there has been a continuous fall in the males afflicted, while in the other sex, the proportion, which rose slightly in 1901, has remained the same in 1911. The proportions borne by the insane at different age-periods to the population at all ages show that in respect of males there has been, since 1901, a large increase at the ages below 10 accompanied by a fall at the period 10-20, and that thereafter the rise and fall alternate till the age of 55, after which, however, a steady increase is noticed. In regard to females, there has been a decline at the ages below 30 accompanied by a continuous rise till 55. Between the ages of 55 and 60, the ratio is smaller now than at the previous Census, while the reverse is the case at the period '60 and over'.

118 The distribution of the insane at the different age-periods with reference to the population living in each discloses the increasing prevalence of the disease with age. The small number at the ages below

ten is probably due to unwillingness on the part of the parents to disclose the mental deficiency of their children. The proportion grows till the age of 45 among males and 50 among females. Thereafter it declines generally, except at the period '60 and over' in regard to males. When, again, the total number of insanics is distributed according to age, it is seen that, in respect of both sexes, the ages between 25 and 45 take in the greatest share. The ages below 25 and above 55 have a larger

proportion of males than females, while the reverse is the case in the intervening period.

Though females are less subject to insanity than males, the proportion per 1,000 males is, it is significant to note, greater than in any other infirmity being 799 all ages taken together. As noticed already the ratio exceeds 800 between the ages, 25—55 outnumbering the males at the period, 45—50 (1,167 females per 1,000). The lowest proportion of females to males is at the ages below ten.

Deaf-Mutism

110 According to the present Census, 84 males and 34 females per 100,000 of the population of each sex are deaf and dumb. If the sexes are taken together there is one deaf mute in every 3,453 persons, or 28 per 100,000. As per the Census of 1901 there were in England and Wales 52 males and 43 females per one hundred thousand of each sex or 46 if the sexes are taken together.

Diagram showing the number of deaf-mutes per 100,000 persons in each Division.

The incidence of the infirmity is greater in the sub-montane and mountainous tracts comprised in the Eastern Natural Division where the proportion rises to 89 males and 28 females per 100,000 of each against 80 and 21 respectively in the plains and open low lands of the Western Division. If the Administrative Divisions are compared with one another it is seen that the southernmost Division covers the area of maximum prevalence (41 males and 31 females). Towards the north, the proportion decreases in intensity. In Kottayam however it rises over that of the two Divisions to the south but is

still considerably less than in Palmanabhapuram.

The affliction of the disease is considered due to local causes connected mainly with sources of water-supply. With cretinism and goitre it has been traced to the injurious properties of certain rivers. Hilly tracts are also said to have their influence in the origination of the infirmity.

120 There has been a large increase under the head of deaf mutism during the last twenty years. Between 1891 and 1901 the actual number afflicted rose by 86 per cent., and between 1901 and 1911, by 22 per cent. The proportions on the total populations however were the same at the 1891 and 1911 Censuses while in 1901 males showed a decrease of 3 and females a decline of one per 100,000 of each sex. In the Eastern Natural Division there has been a steady rise since 1891 in respect of both sexes, as against a continuous decline in the Western Division. Among the Administrative Divisions Trivandrum alone shows a decline among males and females between 1891 and 1911. In Quilon and Kottayam the ratios as regards the sexes have risen while in Palmanabhapuram the rise in males is accompanied by a fall in the females afflicted. The age-distribution shows that, as compared with 1901 the ratios of the deaf mutes of each sex to the total population have decreased among males at the ages below ten and have increased among females at the same ages that thereafter there has been in both sexes a rise followed by a decline till the age of 4 and

that above that age, the decline was kept up by the females throughout, while among males the rise and fall still continue to alternate

121 If the number of deaf-mutes at each age-period is viewed with reference to the population living in it, the proportions afflicted are seen to be higher among males at the ages, 15 to 30, and among females, generally at the later ages Deaf-mutism is a congenital defect, and persons suffering from it are stated to be short-lived If the

Diagram showing the number of deaf-mutes per 100,000 persons of each age-period.

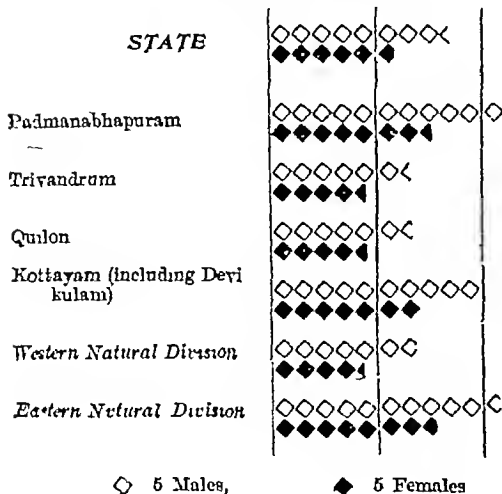

returns are quite accurate, the proportions should exhibit a steady decline from the earlier ages onwards. But it is seen that the ages below ten return very small proportions, while at the higher ages, the ratios go on increasing Probably persons who have lost their hearing late in life have been included, while some children who have been born deaf and dumb have been omitted. At the earliest and latest periods of life, the number of females afflicted to 1,000 males stands higher than at the other age-groups

Among males, the ratio is highest at the ages, 15 to 25, and decreases steadily thereafter, except at the period, 35-40 In regard to females, the ages, 25-30, take in the largest proportion After the age of 30, the number declines, but unlike in the case of males, the proportions fall and rise alternately

Blindness

Diagram showing the number of the blind per 100,000 of the population in each Division

122 The number of persons afflicted with blindness is 35 in every one hundred thousand of the population, or, in other words, one in every 2,817 persons The sexes return a ratio of 42 for males and 29 for females The proportion in England and Wales in 1901 was over twice that in Travancore, being one in every 1,285 of the Population or 78 per 100,000—males numbering 84 and females 73

The infirmity is more widely prevalent in the Eastern Natural Division than in the Western, the disparity in its spread being comparatively

very wide. There are in the former Division 53 males and 39 females per 100,000 of each, as against 34 and 21 respectively in the littoral and deltaic regions. The amount of blindness varies in the different Administrative Divisions, the ratio being greatest in Padmanabhapuram (55 males and 38 females) and least in Trivandrum (32 males and 23 females). Kottayam comes next to Padmanabhapuram while Quilon stands above Trivandrum. The proportional statistics of the Divisions Natural and Administrative appear to lend countenance to the view that blindness is most favoured by heat and dryness and is least prevalent where the tracts are damp and well wooded. Small houses, badly ventilated, which are comparatively more common in the hills, predispose to visual incapacities.

193 Though the actual number of blind persons has increased since 1801 the ratio of either sex on the population has been the same as at the preceding Census, and has largely declined as compared with the 1801 figures. As between the Natural Divisions, the proportion has steadily increased in the Eastern and rapidly declined in the Western Division. The decrease is shared by Quilon and Trivandrum among the Administrative Divisions, and the rise by Padmanabhapuram and Kottayam. The increase is most marked in Padmanabhapuram, and the decline is most noticeable in Trivandrum. The variations by age-periods show that as compared with 1801 there has been in both sexes a rise at this Census in the ages below 10 and a decline in the ages 60 and over. The decrease is shared by either sex at the age periods, 20—30 and 45—55 and the increase at the ages, 55—60.

Inter-sexual variations.

124 If the incidence of the Distribution by infirmity at age and sex, the different age-periods is examined in relation to the population living in each it is seen that though the ratio generally increases with advancing years, it rises rapidly after the age of 30 the males being more often the victims. The distribution of the total blind according to their ages shows no special unevenness in the proportions. However it may be remarked that after the age of 45 the ratios for females are distinctly less than those for males.

Diagram showing the number of the blind per 100,000 of each age-period.

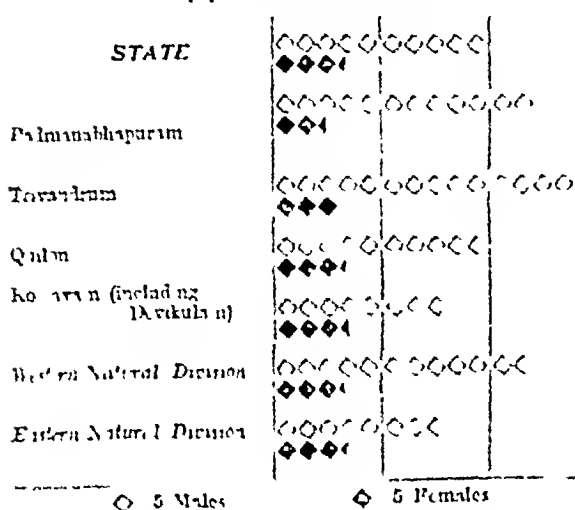

Leprosy

196 In the State as a whole 49 males and 16 females have been registered a leper out of every one hundred thousand of each sex. In the aggregate population one in every 3075 persons is tainted with leprosy. Among the Natural Divisions, the distribution is higher than the comparatively drier Eastern—a

Male and female distribution

enormous that tallies with the conclusions of the Leprosy Commission. The

Diagram showing the number of lepers per 100,000 of the population in each Division

males contribute wholly to the excess, there being 58 males per 100,000 of the sex in the former against 37 in the latter Division. Among females, the disease is prevalent to the same extent in both Divisions, (16). The variations in the Administrative Divisions are considerable. In respect of females, there is a continuous rise in the proportion from Padmanabhapuram in the south (12 per 100,000) to Kottayam in the north (17 per 100,000). But in the case of males, no such continuity is observ-

able. The ratio is highest in Travandrum, and from there it diminishes steadily northwards, falling to 17 in Quilon and to 38 in Kottayam. Padmanabhapuram with a ratio of 60 male lepers comes next to Travandrum. As in the case of insanity, the first place taken by Travandrum is due to the existence at the Capital of a Government Leprosy Asylum, where 138 persons were under treatment at the time of enumeration. Two statements are entered in

DIVISIONS	Males	Females
Padmanabhapuram	60	12
Travandrum	70	14
Quilon	47	16
Kottayam	39	17
Outside Travancore		
Total	114	21

the margin, one distributing the inmates of the Asylum by birth-place and the other comparing the Census proportions with the figures compiled as per the Asylum returns. It is seen that, but for this massing of patients drawn from all parts of the country, the Divisional ratios would, unlike in the case of females, present a descending

scale from Padmanabhapuram onwards, barring a small rise in the Quilon Division.

126 There has been, since 1901, a perceptible decrease in the number of

Inter-censal variations

lepers, the decline amounting to 21 per cent. The improvement is wholly in the Western Natural Division, where the total

now recorded is less by 30.7 per cent than in 1901. In the other Division, a rise is noticed to the extent of 6.9 per cent. The Padmanabhapuram Division has suffered most during the last two decades, the proportion now standing at 60 per 100,000 in the case of males and 12 in regard to females, as against 25 and 7 respectively in 1891. The ratio of male lepers has remained at the same figure between 1891 and 1911, in the Kottayam Division, while in Travandrum and

Quilon it has diminished. Among female lepers, a decrease is noticed in the three Divisions. Distributed by age, the males show between 1901 and 1911 an increase at the ages 0—10 and a decrease at 10—20. Above the age of 20, a rise at this Census is followed by a fall, and this feature continues through all the quinquennial age-periods. Among females, the decrease since the preceding Census begins at the age-period, 5—10 and continues for another quinquennium. Between the ages, 15 and 30 the ratios show an increase over those of 1901 while in the period 40—45 the increase stands converted into a decline. At the ages, 60 and over female lepers, unlike males, show a rise over the preceding Census.

Diagram showing the number of Lepers per 100,000 persons of each age-period.

127 The proportion of lepers Distribution by age and sex, is seen to be exceedingly

small in the first ten years of life, leprosy being very rare among females. There is a sudden increase at the period 10—20 and the rise continues, though at irregular ratios, till the age of 60 when the ratio decreases, the decline being rapid and at a uniform rate.

The distribution of the total number of lepers according to their ages shows that among males, those living at the ages 25—30 and 35—50 are the most afflicted, while females return the highest proportions at the periods 20—30 and 40—45. In both sexes, the ratios are small

at the ages below 25 and from here they grow

Elephantiasis.

128. As already observed the collection of statistics in respect of elephantiasis is special to Travancore and has been confined only to two sea-coast taluks, Sbertalloy and Ambalapuzha where they are most prevalent. The etiology of the disease

Number and distribution.

its origin and spread, were dealt with in the Report on the Census of 1901. At this census it has been returned from all the Divisions except Padmanabhapuram, the total enumerated being 4,317—2,393 males and 1,924 females. The proportion per 100,000 of each sex amounts to 138 for males and 107 for females. The Kottayam Division has recorded the highest number 3,013 or 01.3 per cent. of the total afflicted the sex ratios being 366 males and 291 females per one hundred thousand of each. In Quilon and Trivandrum the ratios are very low being 23 males and 11 females in the former and one of each sex in the latter.

There has been a considerable decrease under this infirmity during the last decennium. Between 1901 and 1911 the actual number afflicted decreased 17.25 per cent. The proportion of males showed a decrease of 98 and females, a decline of 57 per 100,000 of each. In the Eastern natural Division, the decrease is greater than in the Western.

129 If the number of persons afflicted with elephantoid swellings in each age-period is viewed with reference to the total population living in it, it is seen that, among both sexes, the proportion is exceedingly small at the ages below ten, from which it begins to grow till 50—55, where the ratio stands highest. There is a sudden fall in the next period, while at the ages 60 and over, the proportion again rises. Females appear to suffer less from elephantiasis than males, the ratio being 762 females per 1,000 males afflicted.

Infirmitie by Religion and Caste

130 As usual, infirmities have been tabulated by the religions and castes, tribes or races to which the members afflicted belong and are recorded in detail in Imperial Table XII A. As the total afflicted is small, it does not serve any useful purpose to deal with the religions and castes under each infirmity, separately. As remarked in the 1901 Census Report, "it deserves to be remembered that the errors inseparable from statistical inferences based on small figures apply with special force to generalisations regarding the connection between caste, traditional occupation and disease." As a general review of the figures is therefore all that is possible, it has been reserved for the Chapter to close with

In Subsidiary Table IV, proportional figures are given for the four religionists, Hindus, Animists, Muhammadans and Christians. In regard to the Hindus, particulars of disease are entered for such of the castes as have returned at least about 50 infirm persons under all heads taken together.

To take insanity first, the Christians appear more liable than any other religionist and the males more than the females except among Animists, whom the Census declares to be the sanest of all. Among the eight Hindu castes selected for the purpose of this Chapter, the proportion of the insane is highest among the Brahman males and the Paraya females and lowest among the Kuravas. Deaf-mutism is least common among the Muhammadans and most so among the Animists. The Brahmins among the Hindu castes suffer most from the disease. The sex ratios show that this congenital defect is more common among males than among females. Taking religion and sex together in respect of blindness, the Christian males and the Animist females take the first places among the respective sexes. The incidence of visual failure appears to fall most heavily on the Kammala males and the Paraya females and is probably traceable to their respective avocations, the one generally living in the midst of hot furnaces and a smoke-and-powder-charged atmosphere, and the other in the blinding glare of a tropical sun. From leprosy, the Animists suffer most and the Hindus least. Among males, the Kammala lepers predominate, and among females, the Kurava. The smallest numbers are returned by the Brahman males and the Channa females. In interpreting the statistics of a repulsive ailment like leprosy, however, the possibility of concealment by or on behalf of the unfortunates, which may vary with different castes, deserves to be noted.

CHAPTER X.

RELIGION (TABLES V, VI & XVII)

Statistical

131 The religions returned at the Census are entered in Imperial Tables V and VI. The former Table gives the necessary information for the urban population in the State, and the latter for the entire population, urban and rural, in each of the Divisions, Administrative and Natural. Provincial Table VI embodies similar information in respect of taluk areas. The figures contained in these Tables are reduced to proportions and shown in Subsidiary Tables.

Subsidiary Table I—Showing the general distribution of the population according to religion.

Subsidiary Table II—Giving the strength of the main religions in each Division at each of the last four Censuses.

Subsidiary Table III—Showing the number and variations in respect of Hindus, Muhammadans and Christians in each Division.

Subsidiary Table IV—Showing the actual distribution of the Christian population by races and sects.

Subsidiary Table V—Showing, for the Christian population, the distribution of races by sect, and of sects by race.

Subsidiary Table VI—Distributing the urban and rural population by religion.

132 The entire population of the State stands distributed over seven religions. The figures show that the Hindus form about two-thirds, the Christians a little over a fourth and the Muhammadans about one-sixteenth, of the total number enumerated at the Census. In a ten thousand of the population, there are 6,657 Hindus, 2,636 Christians, 661 Muhammadans and 46 Animists. The Hindus and the Muhammadans are relatively more numerous in the Western Natural Division than in the Eastern, being 7,173 and 684 respectively as compared with 5,955 and 629, while the Christians of the latter Division outnumber their brethren in the former in the proportion of three to two. In the mountainous and sub-mountainous areas, the Animists are over four times as numerous as in the littoral and deltaic regions.

Religion	Strength
Hindus	2,232,617
Christians	907,878
Muhammadans	226,617
Animists	16,773
Jews	73
Buddhists	15
Jains	11

Out of a total density of 152 persons per square mile for the whole State, 300 are Hindus, 120, Christians, 30, Muhammadans and 2, Animists. To the increase in density since 1901, the Hindus have contributed most, 33. While the Animists have thinned by one-half, the additions made by the Christians and the Muhammadans are, respectively, 27 and 5.

133. A study of the movement of the population censused under the different religions, as compared with one another discloses a large decrease in the proportional strength of the Hindus and a corresponding increase in that of the Muhammadans and the Christians. In view to bring out this feature fully the comparison has to be carried

Proportional strength of the different religions at the last four Censuses.

back to the earlier Censuses and for this purpose the Animists have to be reckoned along with the Hindus, as prior to 1901 they were not separately shown. To begin with the first systematic Census of 1875, the Hindus, the Christians and the Muhammadans numbered 7304, 2020 and 606 respectively in a ten thousand of the total population. When the next enumeration in 1891 was taken, it was found that the Hindus had lost 62 out of the number they started with six years earlier while the Christians and the Muhammadans had augmented themselves by 47 and 6 persons each. In the course of the succeeding decade 1891—1901, however, the Hindu showed some signs of recovery but was able to get back only six persons, while the Christian missed as many as sixteen. The Muhammadan had an even career.

To the ratio he bore at the beginning of the period, he added nine more

before the period closed. In spite of the fluctuations in development above noted, the main tendency continued unaltered, so that, in 1901 the Hindus were proportionately less and the other two religionists more numerous than in 1875. Another decennium opened and closed only to accentuate the story of decline on the one hand and growth on the other. The ratio of the Hindus went down by 827 while that of the Christians rose by 303 and that of the Muhammadans by 25. Thus in 10,000 of all religionists, the relative proportions were 6001 2303 and 646 respectively. The figures for this Census have shown equally striking results. The loss in the Hindus has been, as usual heavy. They are now lower by 288 than in 1901 the Christians having pushed up their ratio per ten thousand of the total population of the State by an accession of as many as 274 persons, and

the Muhammadans by an addition of 15. To sum up, there are now per 10,000 of all religionists as contrasted with 1875 661 less Hindus and 607 and 65 more Christians and Muhammadans respectively.

The statistics for the administrative units may now be glanced at. As it has

Shows the proportion of Hindus in each District per 10,000 of population

	1875	1891	1901	1906	1911
1. P. W.	8.52	7.314	7.417	7.373	7.093
2. M. W.	17.705	17.833	17.527	17.527	17.527

4. S. W.	8.733	8.770	8.733	8.733	8.733

been possible to adjust and compile separate figures for the previous Censuses

for the newly formed Division of Devikulam, it is taken along with Kottayam of which it has all along formed part. The numerical proportions of the different religions at the last five enumerations, are portrayed and compared, Division by Division, in the diagram appended to this Chapter. The proportions for the Hindus alone are given in the marginal abstract and dealt with here, as that would suffice to explain the periodical changes in situation. As between 1875 and 1881, the Hindus seem to have waned a little in preponderance. In 1891, they appear to have made an endeavour in the Trivandrum and Padmanabhapuram Divisions to gather strength, and this resulted in securing them a relatively higher position than in 1881. But this interim recovery is seen to have only preceded an abrupt fall in 1901, which was so great as to make the position worse than it was in 1881. In the last decade, the decline continued as abruptly in both the Divisions, the decrease in Trivandrum being even greater than in the previous decennium. As regards the Quilon and Kottayam Divisions, there has not been even the brief struggle noticed in 1891 in the other two Divisions. Here, the case has been one of continuous dwindling of the relative strength of the Hindus ever since 1875. No doubt, they have succeeded till now in maintaining their preponderance with reference to the other two religionists, but they have been all through moving downwards. The Hindus of Kottayam have only about 700 to give away. Padmanabhapuram is also tending towards the same situation, though the attainment has perhaps a longer interval of time before it.

If the Administrative Divisions are grouped into the two Natural Divisions and the figures reviewed, it brings out definitely the direction of movement which the statistics indicate. It was observed in the 1901 Census Report, on an examination of the figures till then returned, that the Hindus had been beating a steady retreat from both the Natural Divisions, before the advance of the Muhammadans in the Western and the wave of Christian progress in the Eastern. The history of the decennium just closed has intensified both the advance and the retreat. While in the littoral and deltaic regions, the followers of the Hindu religion are now less by over 500 per 10,000 of the population, the decrease amounts to 700 and more in the interior sub-montane and mountainous tracts, the Christian total being strengthened correspondingly in each Division.

Of course, it should be remembered that the variations in the relative proportions of the Hindus and the Christians are not attributable solely to the frequent movement of the people away from Hinduism. Natural increment has contributed its share towards the observed fluctuation, and if the factor of conversion is to be accurately ganged, the amount of such increment in each decade should be duly credited. The statistics relative to this point will therefore be presently examined. It may be remarked, here, that the degeneration of the socio-economic institution of caste that showed itself in the sequestration and neglect of the labouring classes, the indifference of lay and ecclesiastic Hindu bodies in the matter of the preservation of their faith as a living force in the intellectual and moral life of the people, the atmosphere of unsuspecting toleration one breathes on all sides, the great sympathy and help accorded by the rulers of the State, the status which the religion itself enjoys, and last but not least, the self-sacrificing zeal and devotion of the missionaries as a class and of the pioneers in particular—all these gave vigour to the work, and assured the results. While natural increase has never been unsteady and irregular, propagandist activity has been such as to make it difficult to reduce to definite proportions the augmentation which it succeeds in bringing about—so rapid and great has it been.

134. The marginal abstract gives the order in which the Indian Provinces and States—fifteen in number—arrange themselves in regard to the proportions of the three main religionists in every ten thousand of the population. The Hindus (including Animists) are relatively most numerous and the Muhammadans least so in the Central Pro-

INDIAN PROVINCES OR STATES.	Serial order as regards proportion of		
	Hindus.	Muhammadans.	Christians.
Ajmer-Merwara	10	5	5
Bengal	9	4	9
Bombay	7	3	8
Central Provinces and Berar	1	15	14
Coorg	6	10	4
Eastern Bengal and Assam	13	2	13
Madras	5	12	5
Mysore	14	5	5
United Provinces of Agra and Oudh	8	6	11
Rajputana	4	5	12
Sikhs	11	11	2
Hyderabad	6	7	10
Kashmir	15	1	15
Madagascar	5	14	1
Travancore	12	13	1

vinces and Berar (9,516 and 400 respectively) next come Mysore (9,323 and 514) and Madras (9,044 and 603). The ratio of Muhammadans is greatest and that of the Hindus smallest, in the Punjab (5,455 and 3,846 respectively). Eastern Bengal and Assam (5,023 and 4,982) and Kashmir (7,594 and 2,186). Travancore occupies a low place in both cases—No. 12 as regards Hindus and No. 13 in respect of Muhammadans. In regard to Christians, Travancore and Cochin return in order the highest proportions the third Province Madras, with 288 Christians per 10,000, returning about a tenth of the Travancore ratio. While, in respect

of the Hindus, the proportions range as seen above only between 9,000 and 4,000. Travancore swinging in the middle, the variations cover a very wide sweep in the case of the other two religionists, and especially of Christians. Kashmir at one end has only three Christians per 10,000 of the population while Travancore at the other extreme has nearly a thousand fold. Compared with Cochin, the proportion here is more by 9; in regard to Christians and less by 34 and 40 respectively in the case of Muhammadans and Hindus.

Hinduism.

135. The proportional distribution of the Hindus with reference to the other religionists, and the variation in such distribution from Census to Census, have been considered in para 133 supra. To illustrate that distribution at the 1911 Census a map is given

Hindus and Muslims.

in the margin. The Hindus will now be dealt with by themselves. Between 1901 and 1911 they are seen to have advanced in number from 2,063,708 to 2,208,300. This gives a percentage growth of 11.4 against 10.3 in the previous decade. As compared with 1881 the Hindus have increased by 81 per cent. The present increase of 11.4 per cent. is made up of 13.3 per cent. in the Western Natural Division and 10 per cent. in the Eastern. In the former the actual variation since 1901 has been twice that in the latter 151,645 against 9,917. This was the case too in the decade 1891—1901 62 per cent. of the total number of Hindus are congregated in the littoral and deltaic areas.

1. 0-100,000
2. 100,000-200,000
3. 200,000-300,000
4. 300,000-400,000
5. 400,000-500,000
6. 500,000-600,000
7. 600,000-700,000
8. 700,000-800,000
9. 800,000-900,000
10. 900,000-1,000,000

Among the Administrative Divisions Travancore shows the greatest proportional advancement

(16.2 per cent) and Padmanabhapuram stands last (5.7 per cent). In the latter

Distribution of Hindus by Divisions

DIVISION	1911	1901	1891	1881
<i>Total</i>	10,000	10,000	10,000	10,000
Padmanabhapuram	1,293	1,968	1,462	1,479
Trivandrum	1,868	1,790	1,715	1,678
Quilon	8,831	3,827	3,887	3,817
Kottayam (including Devikulam)	3,000	3,015	2,936	3,001

Division, the Hindus have been growing very slowly. Between 1881-1891, they rose by 5.4 per cent, while in the next decade the increase was only 3.2 per cent. In the other three Divisions, the variations during the last three decades have not been uniform, whether as between one Census and another or as between themselves, but the rate of development has been much greater than in Padmanabhapuram and has, further, been progressively increasing except in Kottayam, where the percentage of growth at this Census has been less than at the previous one by 2.4. The marginal statement compares the four Censuses in respect of the divisional distribution of Hindus. The features noticeable are—(1) that all along, Quilon has come in for the greatest, and Padmanabhapuram for the smallest, share, (2) that everywhere except in Trivandrum, the proportion now is less than it was in 1881, and (3) that the Hindus have been steadily thinning out in Padmanabhapuram and increasing in Trivandrum, while the other two Divisions have been struggling hard to keep in their original numbers.

136 It may seem strange that, around the questions "who is a Hindu?", "What is Hinduism?" doubts should be raised and all sorts of speculations launched in a country, which, according to Bernard Lucas, is "the first-born of all the nations in her emancipation from the slavery of the material and her enthusiastic devotion to a spiritual view of the universe".* The Vēdas, the earliest religious literature known in India, do not, from their multi-form constitution, their archaic diction and their esoteric teachings, evidently lend themselves to a ready deducing of their real key-note. Nay more, they render misunderstandings of the widest range possible, as, naturally, a man or institution, not understood, must needs be misunderstood. It is said that the religion of India does not necessarily involve the idea of a creed in the sense of a definite summary of what is believed. It is no doubt true that, until other religions acquired an interpenetrating place in the texture of Indian society, the question "What is your religion?" had no meaning, and yet has none except to the modernized native of India. The term 'Hindu' is "of foreign and probably Persian origin and is not to be found in the Sanskrit language or in the religious books. It was originally applied to the residents of the region on the further side of the Indus and probably had not a religious connotation". And if it is used with reference to religion in any connotative significance now, it is the persons that first applied the term that should be called upon to explain it. Having given the subject careful consideration, the writer feels prepared to agree with those that think that, in view of the great elasticity of the faith that prevailed in the classic age of India, it would be inaccurate to exclude any form of present religious belief or practice that is not distinctly foreign, such as Islam or Christianity. In India, there was yōga, within the reach of all who may practice it, for the direct knowledge of all that is knowable, there was philosophy for the intellectual assimilation of this knowledge, self-revealed or merely believed in, there were worship, prayer and ritual for securing the aid of influences not within the cognition of the physical senses, and lastly, there was caste,

* Author of "the Empire of Christ"

serving as the functional organization of corporate life planned on the model of nature with differentiation so necessary for efficiency and peace. As long as knowledge is direct and not mediate or inferential neither theology nor religion nor the self-acting social system which was based on them could undergo any great or essential change. So was it in India, more especially as long as yoga was a living practice. A few sects have been formed within recent times. But they have made no impression on the mass of the people whose religion and theology remain where they were before the time of Alexander. To the large majority untouched by influence from outside these institutions have existed only in their concrete application to social life. Hence it was that Hinduism has been defined, by some of those that use the term, as being nothing else than caste. The fact is, that a name foreign to the languages of the people has been applied in the past to the inhabitants and now attempts are being made to stabilize the word by denotations and connotations. In other countries of the world, the religions that are professed are based on revelation, and the religion takes its name from the revealer. For instance the revelation of Christ has resulted in the name Christianity being applied to his followers. So also with Muhammadanism. But Hinduism as a religion, is a religion of self revelation, possible to all. And in the sense that the religious classes of a nation generally cultivated the practice that led to self revelation and that, in the teaching based on such revelation, large populations believed, the term Brahmanism has been used by European writers to denote the religion of India.

187 Certain tests have been proposed for Hinduism. But they are

Tests proposed for
Hinduism.

so divergent that anything in the nature of an uniform standard is clearly impossible of attainment. Moreover when the term Hindu refers not only to religion but also to race

birth-place and social organization it is difficult to say whether a man is within the pale or not, on the basis of a number of tests, some of which refer to his beliefs. It has therefore been suggested that a list of castes and tribes that do not conform to the standards or are subject to certain disabilities should be prepared for the reader to draw his own inferences. The list is to include the castes which (1) deny the supremacy of the Brahmins, (2) do not receive the *mantra* from a Brahmin or other recognized Hindu Guru, (3) deny the authority of the Vedas, (4) do not worship the great Hindu Gods () are not served by good Brahmins as family priests, (5) have no Brahmin priests at all, (7) are denied access to the interior of ordinary Hindu temples (8) cause pollution—(a) by touch and (b) within a certain distance, (9) bury their dead and (10) eat beef and do not reverence the cow. It is extremely difficult to apply the above standards to each caste and draw up a list. Further whatever may be the state of things elsewhere such tests cannot be applied to this part of India. The profession of Hinduism does not hinge on them.

To take what is considered by foreign writers, as the keynote of the social edifice of ancient India, it is the acknowledgment of the supremacy of the Brahmins. But in the constitution of Indian society where all have their appointed duties (dharma) to each other the question of superiority cannot arise. If such a claim has cropped up, it is a sign of disorganization and decay. Again with the Brahmins as representing the religious organ in the body politic his non administration to the other castes is only a disordered state and does not take away the title to be so ministered to still less cast them out of the socio-religious

organization. As for gods—there is only one God in the sense of ultimate cause, or God of absolutism as he is called, and all the rest are powers of various degrees of influence over the world's affairs. The Indian negotiates with all of them. But some are partial to a few, whom alone they may have got to know and learnt to believe in. But this cannot affect the question of their adherence to the main religion.

Again, in regard to the authority of the Vēdas, it may be observed that in a society where, as a matter of fact, the study of the Vēdas is limited to the section whose function is defined to be spiritual ministrations to the entire community, the Vēdas do not come into direct contact with the mass of the people, and if they have in course of time ceased to think of it, it is no more than a passenger in a ship, believing or disbelieving in the existence or value of particular portions of the machinery, however vital, and cannot affect the fact of his being borne by it.

Not are temple worship and access to temples criteria of Hinduism. Castes that do not enter, worship from outside, and among them are devotees no less earnest and attached. Pollution again is more an observance than an essential of religion. A Brahman, it is said, should not touch another Brahman, if he wishes to be ceremonially pure. It is in connection with ritualistic convention that this question of purity and pollution comes in. Further, a caste is polluting with reference to another caste and not with reference to its claim to be classed as a Hindu.

What may be the test—As far as enquiry has gone, the ancient religion of India may be expressed in one word, Karma. Karma is not paralysing fatalism but inspiring effort. It is the tracing of happiness and misery, righteousness and sin on earth to one's own individual activity (Sanskrit Karma), comprising thought, word and deed, and was the belief of the ancient world. The contrast as against Christianity has been taken to be that "the Christian regards sin as something which affects the whole human race, while the pagan believes it to be the mistake or misfortune of individuals."* As all action, right or wrong, proceeds from desire, and as desire springs from the mind, the mastery of one's mind, and of habit to which uncontrolled mental activity makes man a slave, constitutes true worship, and all rites and ceremonials are either preparations for, or applications of, that mastery. What with the freedom of speculation characteristic of what was once an advanced civilization, and what with the lack of Church organization similar to what obtains in the West, an authoritatively formulated religious creed is wanting in India, and the ideas of religion as now recognized and the term 'Hindu' now naturalized, being both foreign, it is no surprise that vagueness and uncertainty should have gathered round the subject. But any religious faith or practice to which the test just indicated would apply must be accepted as some form or other of Hinduism, in the sense of the original religion of the Indian continent. In the last India Census Report (para 634), the acceptance of the Brahmanic supremacy and the caste system have been referred to as the most obvious characteristics of the ordinary Hindu. Under the organismal conception of the Indian system of social arrangement, the Brahman has his function to the rest of society, and is supreme in that function. To speak of the supremacy of the Brahman in any other sense is no more permissible than to speak of the supremacy of an organ in the body physical. The Jains, though they do not accept the Vēdas, probably on account of the

animal sacrifices the latter sanction, recognize the caste system and some of the deities accepted by their Indian brethren. Kennedy calls Jains a Hindu sect."

138. There are in Travancore 7,401 temples of all sizes and description, 1,560 being under the management of the Government by virtue of the circumstances referred to in para 2 of the Introduction. Of

Temples.

the latter 360 are major temples and 1,183 are minor ones. To the Hindu the temple is not solely a place where the congregation gathers, to pray or to listen to a religious discourse. To him, it is also a spiritual laboratory where are generated, conserved and dispensed, powers not at the service of the ordinary individual whereby the pleasures of life are enhanced, pains counteracted, and the ascent towards the highest goal helped. The science of the collection and preservation of these powers is called the Tantra Sāstra. The temple is also intended to serve as a retreat for study and meditation, what are called aura or magnetic influences in the temple and its vicinity being arranged to be so prepared and safe-guarded as to help the restraint of the passions, the concentration of the mind and the development of the higher consciousness. A large volume of literature on temples and kindred subjects has been handed down such as Āgamās which are the original writings on Occultism consisting it is said, of 8,700,000 verses. Tantras (meaning in their limited sense magic and mystic formularies for the worship of the deities and the attainment of superhuman powers) such as Pancha-sātram Pāsupatya and others, Kalpas (meaning procedure in religious rites and ordinances not wholly relating to temple worship) Yōga sāstras, Mantra sāstras and other treatises relating to the rituals prescribed in the Smṛtis and the Śrutis. In Malabar a concise summary of all this varied lore has existed in the form of Tāntrika Granthas, of which the Tantra Samucchavāt of the great Chōnnasāri Nampūtiripid is the best known. It is the recognized authority and guide on this coast and is elaborated in the spirit of Advaita philosophy. Temples are also believed to have a cosmological import. When there are seven enclosing walls or Prākāras round a Yīgraha or image they are taken to represent the seven Vyākṛtis, or the seven Dhātus or components of the physical body remaining within which the seer perceives the entire manifested existence or the seven Gūḍas Bhūmākas or stages of march towards the highest goal. Five walled temples are taken to illustrate the five Kōṣas or sheaths of the soul, according to the Vedānta. Three stand for the three sūkṣmas or bodies, the stūla (gross) sūkṣma (fine or astral) and kāraṇa (causal). When a temple is a unicolinar one it indicates the Brahman Tatva (real self-existent one) enveloped in Māyā or illusion. The temples in Malabar are generally tri-walled edifices. That temples are comparatively ancient institutions is evidenced by the reference to them contained in the Gāṇapatya upaniṣad and Śāitāpī-smṛiti. The former teaches that the realization of mantras is easiest accomplished in the presence of images and temples.† The latter declares that

See page 200—Religious and Philosophical of the East.

† B. way of answer to the question that I often asked, whether the planting of images and the building of them in the state of the God head coincided with the commencement and other extraordinary altitudes of divinity the Tantra is not the pure evidence as part of materialism or hymn concerning following those from the installation ritual or ritual. Very ancient devotion to God. He is ordered to make his concentrated self absorbed in the image in the use of the mantras and he very high degree, striking upon the mind at once with over-powering conviction just as in the nature of which is revealed in the practice of the art and in the friction of hard substances, the fire.

a Brahman who performs temple service for three years as a means of livelihood becomes what is called a *Dēvalan*, disentitled to perform the ceremonies intended for the *Dēvas* and *Pitris*. Hence is probably explainable the practice in Malabar, restricting the ordinary tenure of a temple-priest to three years.

Malabar temples are known to be of three classes, *Grāmakshētram* (temple intended for a particular village), *Desakshētram* (intended for all the inhabitants in a *Dēsam* or tract) and *Grīhakshētram* (household temple). Of the *Dēsakshētrams*, some belonged to the Malabar Brahmans exclusively, while others were common to all denominations. Some of the former class were the seats of Vedic instruction as well, and were called *Ōttampalams* or temples of Vedic teaching. But with the onset of degenerative changes probably, *Ōttampalams* declined and gave place to *Kūttampalams*, where purāṇic recitation in a merry strain is gone through by *Sūtras* or *Chikkāṭṭas*. Then came the need for the provision of special *Ōttūtṭūs* (Vedic boarding schools). But with the causes, that led to the decline in vigour of *Ōttampalams*, left undetected and unremedied, it is no surprise that the *Ōttūtṭūs* of which there is one in Travancore, became mere *Uṭṭūs* (feeding houses). Attached to the temple of *Tirumūlukkulam* in the *Mangad taluk* where, in the vicinity of the temple, there were, it is said, a large number of rich *Nampūturi illams* and which with such a congregation was, to judge from a writing on the *mukhamandipam*, able to purchase the *Nermangalum Hills* now included within the High Range Concession area for some parais of *Rāsas* (gold coins now not current), was one of the largest *Ōttampalams*. Lands said to have been endowed for the maintenance of this Vedic school, and since dissipated after the fall of the *Paim Raja* to whom the tract was subordinate, still bear the name of *Uṇṇippūṭam*, (paddy lands of *uṇṇis* or *Nampūturi* youths). It is worthy of mention that *Nampūturi* boys in their *Brahmacharya* stage are prohibited from visiting a *Kūttampalam*.

139 Image worship at home and in temples built and consecrated for the purpose

Image worship with reference to the goal of religion is a distinctive institution among the followers of the Aryan religion in its manifold phases. Although, in the anxiety to exonerate themselves from the charge of venerating what is in substance but a piece of stone or metal, apologists have not been wanting to explain away these *Veṅgahas* as mere symbolic representations to catch the popular mind or, at most mechanical aids to concentration, the fact remains that, according to Hindu scriptural texts and to the belief of the great mass of worshippers, the image is a living Divine presence. The basic theory of image worship, as far as one is able to make out from enquiry and research, is that, in the image, a particular Power among the various Powers or Gods provided in the scheme of cosmic order for the regulation of the drama of the universe is embodied, and placed by an expert exercise of concentrated thought-power within reach of those who may not have the power to dive into the occult but none the less real world. The process by which these powers are vested in material objects and enabled to manifest their influence is not understood as clearly as one would wish. But if to the Hindu, the highest goal of religion is self-realization through the process of *yōga*, image-worship is *yōga* externalised. Man's ultimate aim is to be happy and free. If abiding happiness be the result of a perfect social arrangement, freedom at all times can come to him, only when all the bonds of physiological, domestic and social relationships have been dissolved, his conscious entity being alone left in full realization of the highest. The complexity to which is due the higher efficiency of the evolved forms in the universe, is really made up of these bonds. While an arrangement, under which they will lie without chafing, will help them

As in *yōga*, *yama*, *niyama*, *āsana*, *prāṇāyāma*, and *pratyāhāra* are the necessary preliminaries of the *Pūga* process* But the three subsequent stages, *viz*, *dhāraṇa* (fixing the mind), *dhyaṇa* (contemplation of the entity to be realized) and *saṁādhi* (the realization itself), are with reference to the image, instead of to the *Ākāśa* of the heart Images as external objects thus serve a two-fold purpose They aid the practice of *yōga* by furnishing a concrete object towards which attention may be easily and effectively concentrated They also serve as media in which the self-realized adept may localize, by a process of transference (*Āvāhana*), the entity sought to be negotiated, and bring it within the reach of the average worshipper The initiates (or *divyas*) may use *Agni* for this purpose, the munis or adepts in *mananam* or contemplation would live in the recesses of their hearts, but to those whose inner sense has not been awakened, *pratīma* or image enables the highest stage being attained, though, finally, the great seers could see the Divine in every thing †

140 *Pūga* is of two kinds—one in which the *Pūgakan* spiritualizes the image from within himself and becomes one with it, and another in which he stands separate Just as in *Advaita Yōga* *Samādhi*, the *Yōgi* becomes merged in that which his mind was directed towards, so in *Advaita Pūga* *Samādhi*, he becomes one with the entity sought to be embodied in the image For that purpose, he merges his physical body as represented by its five primal elements or *Panchabhūtas*, in the body of the entity invoked in the image—of course incomparably fine—through the offerings of *Gala*, *Gandha*, *Pushpa*, *Dhūpa* and *Dīpa* He likewise seeks to merge his five *Prāṇas* or life-forces through *narvēdya* or edible offerings, by which the fire of physiological life is, we know, nourished and maintained The merging of the mental body in that of the deity is then effected through the repetition and meditation or *gapa* of what is called the *Mūlamantra* or mantra of the deity Every power is a *Dēva* and is said to have a form in which he is perceived by the seer of the occult world above referred to, and a mantra or arrangement of words according to a particular modulation of sound, by the utterance of which its realization and influence are secured That form is projected into an image by one who has realized it in himself, and the mantra, also infused by the original founder or *Pratishṭāta*‡ with the requisite power and efficacy, is taught as *upadēśa* to the *pūgakan* or priest who has to work with that image ††

In the typical Malabar temple, where the *Tantra Samuchchayam* guides all the ritual, for instance in the *Srī Padmanabha Swami's* Pagoda at Trivandrum, the

* *Yōga* is understood to consist of eight parts (*aṣṭāṅgas*), namely *yama* (restraint), *Niyama* (obligation), *āsana* (posture), *prāṇāyāma* (regulation of breath), *pratyāhāra* (abstraction), *dhāraṇa* (concentration), *dhyaṇa* (meditation) and *saṁādhi* (realization) The first four constitute the preparation, the fifth and the sixth make up the substantive process and the seventh, the consummation

† Says Krishna in his *Uttara Gita*
Agnirādēvō divyātīnām
mūṇīnām hrīdī dēvatām
Pratimāsvaprabuddhā sām
sarvatra samādarsanā n

‡ *Pratishṭa* or installation is the consecration of the sacred fire or *agniādihānam*, the *utsavas* or festivals correspond to the *yāgas* or Vedic sacrificial feasts and the daily ceremonies connected with *Agni*—*Nityaupāsanam* of the *grīha*, the *Samīdhādihānam* of the *Brahmachari* and the *Agnihōtra* of the *Dikshita*—are the analogues of the daily *Pūga*

†† In these *Pūgās*, as in all Hindu religious rites, the influence of mantras, as words arranged according to certain modulation of sound is, of course, brought into exercise "The central idea involved in the working of the mantras is that certain sounds when uttered produce a disturbance in the *Ākāśa*, which is in its turn communicated according to the severity of such a disturbance, to the higher plane The nature of the disturbance cannot be judged from the known laws of physics, as that science has rarely dealt with the higher planes of matter"

High Priest or Periya Nambi as he is called, is not to do any obeisance through prostration, or to walk around the rectangular outer corridor (Sribalipura) except with the Svāmi (deity infused image). In fact, he is supposed to have no existence independent of the Svāmi, in whom he has merged himself by the advaitic process of Pūga.† Even while entering the inner quadrangle for the morning and evening service he goes from right to left, *Apradaksagāma*, and not from left to right as is the conventional form of proceeding for the ordinary worshipper. In the Viśvādvaita and Dvaita Pūgas, as in their respective yōgas, Samādhi is not the abolition of separate individuality for the pūgakan or Yōgi, the efficient cause of the universe as well as all the subordinate entities being at all times, separate existences. The end of the Pūga therefore, conceived and performed, more or less as above described, except that there is no merging in the image but only a process of investing it with attributes and powers, does not see the Pūgakan unified with the deity. He is only brought into the deity a direct living presence in a state of extreme sublimation or part divinization as the case may be. While in the Advaita Pūga, the priest infuses his self realized divinity into the Svāmi and keeping one with him wills for the benefit of the congregation, the Dvaita and Viśvādvaita Pūgakan often draw the divine force symbolically from the sun, as the most striking and marvellous object in nature, and having duly spiritualized the image address their prayers. The final pūga which ends with samādhi is known specifically as Prasanna Pūga or Pūga intended to bring the divine entity close to or within reach of the worshipper and as, in yōga, it is the period when great powers or Siddhis are acquired and prayers made and responded to.

During the Prasanna Pūga period, the Deity invoked is conceived and realized as holding the Amṛita Kalasa or cup of blessing in his hands. Towards the end of the samādhi, the priest is to transfer from the cup the ambrosia virtue to a vessel of water and with it to bathe or sprinkle the worshippers, after presenting the divinity-suffused image to the illumination of lighted lamps of various kinds. This is the time for the worshippers to offer their prayers direct, and to be enthused and sanctified by the divine presence. Flowers sandalpaste etc worn by the image and the lighted camphor waved over are believed to serve as so many media of divine blessing hence their value and significance as *prastāva*. The functions connected with images and temples are all expected to be performed by great adepts in yōga.‡

Nambi, or Nambian as he is called in the Tamil country the term to which all temple priests are in strictness entitled, is now applied in Travancore only to those for whom an umbrella still serves as an essential part of the official outfit. As in the case of the Saṁnyāsi, especially those having functions in temples, and of the Malabar Brahman female the umbrella is intended to keep off the sun or, and to screen oneself from things that may in varying states and degrees and under varying conditions of proximity or contact distract the mind or rouse distaste for which *Aśuddham* or pollution is only a conventional term. This umbrella is formally given to the Periya Nambi in the Tiruvārum Paṇḍi by the representative of the great Divākara Saṁnyāsi who was the first founder of the shrine. The representative is a Nampūtiri belonging to one of a particular group of villages, who accepts the *saṁnyāsa* and gives himself up *ate alia* to the duty of image spiritualization. They are called *Pūgapaṇḍi saṁnyāsi* and are expected to go on annual tours to the chief temples on this duty.

† The drawing of the umbrella (*śatallakṣa*) is one of the symbols and of snake emblems for female sanctity among the *śaiva* and *śākta* sects. See *Śaiva* and *Śākta* sects, and as an account of which the reader is referred to pages 211–212 of the last volume of the *Journal of the Asiatic Society of India*.

‡ *Archaṅgama* is the Tamil name.

According to the Tibetan Saṁkhya, the fulness of temple ritual is dependent on the psychic power (*Ṭ*) of the devotee. The *Ṭ* is the power of the mind, the power of the senses, the power of the organs, the power of the elements, and the power of the body and mind. The *Ṭ* is the power of the mind, the power of the senses, the power of the organs, the power of the elements, and the power of the body and mind. The *Ṭ* is the power of the mind, the power of the senses, the power of the organs, the power of the elements, and the power of the body and mind.

Archaṅgama is the Tamil name.

The *Archaṅgama* is the Tamil name.

141 Though there are reasons for thinking that image worship is not unsound in conception, and was once effective in its purpose, it must be confessed that, as now seen, it is such as to discredit the theory and falsify the practice. To the administrative and ecclesiastical functionaries, who are equally responsible for the state of affairs, the taunt levelled by Garrick at the clergy-men of his time may perhaps well apply—"you, clergymen of the pulpit, treat the real as if it was fictitious, we, players on the stage, treat the fictitious as if it were the real." The Tantrīs are the spiritual engineers in the domain of image worship. And in view of the small measure of sympathetic or constructive interest the Hindu ecclesiastic, as a class, receives, as contrasted with his Christian brother, with whom he is often compared for fitness and character, though not for reveredness and remuneration, the priests and the Tantrīs, especially in Malabar, deserve the thanks of their clientele for at least standing by their hereditary tasks so long. But it is no exaggeration to say that, in India generally, the religious personnel has not been maintained to anything like the desirable level, and that the cost, whatever it may be, of guarding and enhancing the spiritual efficacy of images, has not been made the first charge on the finances of the temple or on the attention of its wardens*. The recognition has yet to come that whatever is worth doing is worth doing well. When along with these facts are considered the limitations which, in the words of Crozier, "our beggarly senses impose on our understanding and which restrict so greatly the number of the laws of nature which we can possibly discover, as well as forbid us to understand the nature of the forces engaged, in the same way as a dog seeing a man looking through a telescope might understand his movements, but not their motives," it may seem rash to reject the principles and details embodied in temples and their ceremonial, as unproven or unprovable.

142. In regard to temple-visiting or Kshētīa-darsanam, there are three modes or spheres of approach for purposes of eyeing and adoration. They are called *Bāhya-darsanam*, *Madhya-darsanam*, and *Antar-darsanam*. As if by an arrangement likely to best serve the object intended, worshippers belonging to the several grades of concentration-power seem to range themselves under one or other of these groups, and are expected to graduate their conceptions accordingly. Some restrict themselves to *Bāhya-darsanam*. They stand outside the temple enclosure. To them, the portion between the outer wall (*piākāyam*) and the second wall or quadrangular structure (*nālampalam* in a Malabar temple) would be the gross body or *Stūla-sarīra* of the deity, the portion within the *nālampalam* and outside the sanctuary proper, the astral body or *Sūkshma-sarīra*, and the sanctuary itself, the causal body or *Kāraṇa-sarīra*. The image is the deity. Persons whose powers of concentration are slightly higher would find the *Madhya-darsanam* possible and more satisfying. They would stand just outside the *nālampalam* or second wall, and to them the *nālampalam* and the space within would be the gross, the sanctuary or *Srikōṭi* where the image is actually accommodated would be the fine, the image itself the causal body, and the force conjoined up in it as the *Ātma* or the soul of the deity. Here, it may be parenthetically remarked that, in all temples, Vēdic recitation by Brahmans is recognized as a standing institution, and that the environing quadrangle (*nālampalam*), front platform (*mukha-mandapam*) and the porch (*vāṭi-māṭam*) were originally intended for their accommodation. Even now, in certain Malabar temples where *Trisandhas* or *Panchasandhas*† are gone

* The general neglect from which even some of the well-endowed temples have to be rescued bears out the warning recorded by Dr. Cornish—p 107, Madras Census Report, 1872.

† *Trisandhas* and *Panchasandhas*—These are recitations of the *Rik* and *Yagur* vēdas respectively in some important temples, continued without break by day and night. As the *Rigvēda* is to be recited three times, and the *Yagur* five times, in consideration of the greater length of time required for the former, these recitals have obtained the names of *Trisandha* and *Panchasandha*.

through, the inside of the *nālampalam* is so fully engaged by the Vēdic reciters that persons who may otherwise perhaps resort to *Antar-darsanam*, content themselves with *Madhya-darsanam*. A third class go in for *Antar-darsanam* and take their stand in front of the *Srī-kōil* within the *nālampalam*. They regard it as the *Sīkha śarira*, the image as the *Sūśkma śarira*, the life-force centred in it as the *Kāraṇa śarira* and the *chit* or ultimate essence as the final object and goal of all meditations and aspirations.

143. There are two important Sannyāsi mutts in Travancore owning properties and exercising dominion over certain temples—one at Minchirai in the taluk of Villavankod and the other at Tiruvārppu in the Kottayam taluk. They exercise no ecclesiastical function in reference to any congregation. One of the items of spiritualization service in the *Srī Padmanabha Swami's* temple—*puṣkpaṅgal*—is to be performed by a Minchirai sannyāsi for six months in the year. The sannyāsīs of the Minchirai mutt are in receipt of personal allowances from Government, and the mutt properties enabled as it were to be applied solely to religious purposes. Two non-Brahmanical sannyāsi mutts presided over by *Pandāra sannidhis* with their head-quarters in British India, also hold considerable properties in South Travancore.

Śringeri mutt—In the last Report, a note was entered of the relation of the great Sankara, the apostle of the Advaita philosophy to Travancore. Of the mutts which he founded, the one at Śringeri in the Mysore State, has alone held direct touch with this country. Although like most heads of mutts, so many apices in the Hindu sacerdotal structure, that at Śringeri too has no organic place in the religious life of the people such as may be expected, the great name with which the mutt is associated and the uniform personal excellence of its presiding heads have always commanded respect. During the decade, the late lamented incumbent of the Śringeri Pīṭa, caused two memorial temples being erected at Kāṣāṭi on the site of Sankara's ancestral home, at great cost. The movement met with a hearty response throughout Malabar. On the occasion of the visits of the Śringeri Svamis to Trivandrum the Maha Rajas show the highest courtesies, and the spectacle of a reigning sovereign in his full kingly robes waiting at his principal fort gate to receive the representative of Adī Sankara seated in his palanquin in semi royal state and receiving his benedictions from below reminds one of the Kshatriya kings of old who delighted in showing their reverence to their great Gurus and Achāryas. It is believed that, with the several concessions graciously made by His Highness Government, and the interest shown by the Maharajah of Mysore who as a śishya of the mutt, undertook a visit to Kāṣāṭi, the long forgotten birthplace of Sankara would, when the programme that appears to have been laid out is carried into execution emerge as an important centre of Indian Vēdāntism.

144. The belief in the existence of entities presiding over the various forces and phenomena of nature and subject to the influence of concentrated thought power directed to the accomplishment of mantras, lies at the bottom of the sacraments—religious rites among the followers of the Vēdic religion of India. While those whose development in the art of yōga has reached the point of realization or samādhi, as referred to in the paras on image-worship, are said to be able to translate their will into accomplished deeds merely on their resolution those who have reached only the stage of dhāraṇa or concentration are just able to focus, on the field of their inner vision, the particular entity or entities sought to be negotiated. Having so focussed, they direct the māntric influence and secure various objects connected with physical and mental

well-being The Smṛiti texts contain accounts of these saṃskāras Their more significant features are briefly noted below

Garbhādhānam—The marriage consummation or nuptials, as the term is specifically applied in India, where ante-puberty marriage prevails In this ceremony, the powers of the occult world concerned in the construction of an infant's personality, are to be invoked on behalf of the couple by the realized Brahmins for their influence being exercised in the most favourable manner The Smṛitis make mention of details of day of conjugation and personal hygiene for the would-be parents, and indicate the effects of each course of conduct

Pūṃsavanam—This is another rite performed during the state of pregnancy and is believed to correspond with the determination of sex It is intended to ensure the offspring being a male The actual process through which the object of the ceremony is to be attained, is the handing by the husband to his pregnant wife, of a small quantity of curdled milk with a grain of paddy of a particular kind known as yava and two grains of moth pea (māsha) Before sipping this drink, she is asked by way of attention being prominently drawn, what are you drinking? (*Kim pibasi*) She then answers, as it were by way of openly expressing the exercise of her will-power in the desired direction of sex-determination, *Pūṃsavanam*, i.e., the rite that would give male offspring This item gives the name to the whole ceremonial

Anvalōbhanam—This rite is to ensure that the son to be born may bring on no manner of distress The objective process consists in the dropping into the right nostril of the woman, the leaf juice of the nyagrōdha plant (*Ficus Indica*)

Simantōnnayanam—In this rite of thanks-giving propitiation of the deities presiding over the construction of the child, the principal ceremonial act is the parting of the hair of the woman from the middle of the upper line of the forehead, with a stick consisting of a white-spotted spine of the porcupine and a blade of darbha grass to the accompaniment of the Vyāhṛiti mantra The ceremony concludes with a specific invocation to Sōma to bless the human race This is a ceremony of the 6th or 8th month after pregnancy

Jātakarman—This is the natal or birth ceremony prescribed to be performed immediately at birth After the usual invocation to the deities, ghee and honey in which a gold piece has been rubbed in, is applied to the baby's lips with a view to longevity under divine protection. *Mēdhāgananam*, or the rousing of mēdhā (consciousness or intelligence), is an integral part of this ceremony From the mantras to be then pronounced, its object may be inferred to be the stimulating of self consciousness, which in the ordinary human being is believed to be deadened in varying degrees *

Nāmakṛāntam—The name-giving ceremony performed usually on the twelfth day after child-birth Names with even number of letters are recommended for male children and odd for females The chief mantra purports to declare that the child is a copy of the father, organ by organ, and represents the father in that copy, and to pray that it may live a hundred autumns,

Karṇavēdham—The boring of the ears is regarded as a sacrament, though unaccompanied by mantras or rites Its time of performance is within the first year of age

Upniṣṭhkrāntam—The taking out of the child for having the first look at the sun and the moon is also a sacrament It is performed in the third for the sun, and in the fourth month for the moon Here, it may be stated that, as most of these ceremonies are kept up not so much by force of reason and conviction as of habit and hereditary belief, this ceremony with a few others has already gone into disuse,

Annaprāśanam—This is the first rice-giving ceremony and is timed for the sixth month The chief mantra is an invocation, that the Lord (of food or food-giver) vouchsafe food that nourishes and has caused pain to none, that the (immediate) giver may be protected and that life power may reside in all men and animals—*Dvipādām* and *Chatuṣpādām* (bimāna and quadrumana)

Chaulam or tuft-making ceremony—In this, comes in for the first time, what is called *Ankuraṇam*, or the offering of sprouted grain The Ashtadīkṣās or the special deities that rule the principal quarters of the universe are worshipped The tuft or Kēśam with the sacred

* According to Hindu Medicine, gold preparations promote long life and clearness of intellect. In royal households drinking water is boiled with a piece of fine metallic gold

Vina yachchikhrya karma || Vina yajñōpavitātāh
Rākshasam tadāhi viṣṇūḥ || Samastā nishphalā kṛyāh

There are various detailed rites whose significance not being clear, it serves no purpose to enter into. They are all acts of prayer to the various invisible deities believed to have influence. One or two items seem striking. Just as in the Vivāha ceremony which, as mentioned in the Chapter on Civil Condition, corresponds to the Upanayana for the male, the husband being the Āchārya or preceptor, we have the *Udakapūra* or the pouring of water from the Āchārya's hands into those of the pupil. Again, by way of annexing the pupil to his own personality, the Āchārya touches the breast of the Sishya over the region of the heart and repeats a mantra meaning thus:

"In to my will, I take thy heart
After my mind shall thy mind follow,
In my Word thou shalt rejoice with all thy will,
May Brihaspati join thee to me."

Then follows, the exhortation to the Brahmachārī, such as, learn the veda, perform the appointed rites, do not sleep by day, be devoted to the teacher, dedicate twelve years to each veda &c.

Food should be begged, no more than necessary, not from the houses of relations or preceptor, nor from houses where vedic recitation and sacrificial rites are not observed. The food is to be eaten in silence and without any feeling of mental or physical distaste. On the fourth day of the Upanayana is the rite called *Sradhā-Mēdlā* attention and intelligence ceremony. The deity known as Susravas is invoked, so that, as he (Susravas) is the preserver of the treasure of sacrifice for the dēvas he (the Brahmachārī) may, through attention and intelligence, become the treasurer of knowledge for the good of the world. This Upanayana ceremony or the leading up to the Gāra as the word goes, is followed by a number of *vr̥tas* or epochal rites, corresponding with the several courses of vedic study. They vary according to the *Sūtrakāṇḍas* or ordinance-makers.

Gōdānam—The *Gōdānam* ceremony marks the termination of pupilage, the Brahmachārī who is not to shave his hair, nor use any scents or flowers, who is to have no elaborate garments, who is not to move about and hence has no need for shoes, head-dress or umbrellas, is now to get shaved and to cease from the proscriptions ordained for the *Brahmacharya* stage. He then after having made his obeisance, to his preceptor, garu vandana, and offerings, given dakshina, in which the gift of a cow (*Gōdānam*) is one of the items, returns to his home. This returning is called *Samāvartana*. The period between the completion of the Brahmacharya stage and vivāha is known as *Snātaka* stage. He may spend it as a continuation course of instruction, or he may travel, acquiring and imparting knowledge. During this stage, he is to make certain prescribed offerings to the fire, live on spare diet and avoid even the most distant chance of the rise or development of the sexual appetite.

Vivāham—The sacrament of marriage for obvious reasons is the most important of all the *samskāras*. The *Smṛiti* writers are mostly for the marriage alliance being contracted, with a clear period antecedent to the attainment of puberty by the female. Bōdhāyana, Samvarta and Brihaspati attach great stigma and religious demerit to parents and guardians, responsible for puberty among spinsters. Manu, however, would rather keep a girl a life-long maid rather than saddle her with an unworthy husband, such is the recognition by the ancients that marriage has its use and misuse, its virtue-guarding and its vice-disseminating properties. The objects of marriage are laid down as *dharma* and *praja*, namely, the securing of a helpmate for doing the appointed duties to society, and the ensuring of a progeny to continue those duties ever after he has ceased to do them, either through change of *asrama* or death. The usual propitiation of the deities governing the various forces at work takes place in the form of *hōmas* and prayers. On the night of the marriage, is a significant item of ceremonial known as *Pravēsa-hōmam*. It indicates that the married girl proceeds immediately to the house of the husband and

* This makes forty-eight years, the total period of vedic study which, with a longevity of a hundred years and over, (*satyuk purushah*) is not an extravagant term. But when the circumstances that enabled the study of all the four *Vēdas* by an individual, changed, one of them was chosen and became the *śākhā* of himself and of his progeny. Hence the diversity of *śākhās* or accepted *vēdas*, among the same *Gōtra* or paternal stock. There is an endogamous section of Brahmins—possibly there are more than one but of which the writer is not aware—among whom there are followers of only one *vēda*. Either a territorial group of Brahmins who became reduced to the study of one *vēda* became thus *subcaste*, or it represents a class who, having, earlier than others, given up ecclesiastic function which, to be efficient, requires the study of all the *vēdas*, contented themselves with one of them and formed a special group of their own.

helps him in starting the *Ciriyada* stage of life. Among Mahabar Brahmins, the subsequent ceremony takes place in the house of the husband and from this ceremony to be gone through on this day it is at, there is a substantial reason for believing that, at one time, the age of marriage was still an advance for the married couple to live together as man and wife. As observed on page 333 of this report, this practice was considered undesirable and appears to have been subsequently given up. Ganharra, the presiding deity of the murses, is an object of special attention during the marriage days, and the dancing and music are intended in his propitiation. The daily sacrifice to the fire, which to the householders represents Divine effulgence, begins with the commencement of the married stage.

Muhammadanism

11a. As per the 1911 Census, there are in the State 326 617 Muhammadans, the addition during the last decennium being 86 051 or 18.9 per cent. Though the net increase has been greater than in 1901 by 4 808 persons, the proportional growth as compared with the previous decade has been less by 1.1 per cent. But if an earlier decade is

Muhammadans—
Number and variation.

Map 12a

also taken in, it is seen that between 1881 and 1911 the absolute addition has been as much as 70 708 or 51.8 per cent. In regard to the Western and Eastern Natural Divisions, it is noted that they divide the Muhammadan population in the proportion of 60 and 40. Per 10,000 of all religionists, they number 684 in the former and 630 in the latter. Since 1881 the Western Division has added 49 to this ratio, and the Eastern, 51. The map in the margin distributes the Muhammadans over the Administrative Divisions with reference to 10,000 of the population in each. It shows that they are most numerous in Trivandrum. Since 1881 the relative proportions have steadily increased in all the Divisions, except in Padmanabhapuram where there has been a steady decline. In this Division the ratio with reference to its total population is now less by 25 than in 1881.

The variations in the number of Muhammadans from Census to Census

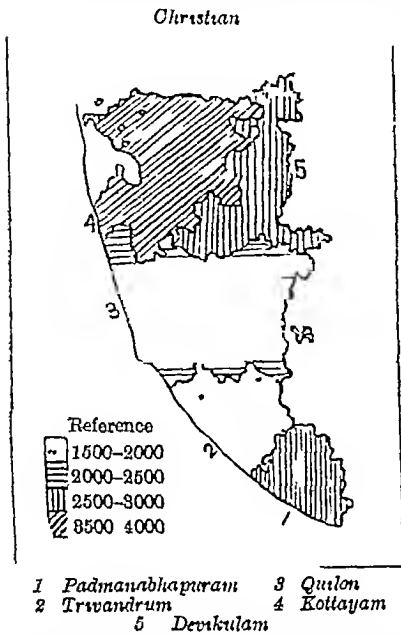

Distribution of Muhammadans by Divisions

DIVISION	1871	1901	1901	1911
Total	18,009	10,000	10,000	10,000
Padmanabhapuram	615	736	837	1,011
Trivandrum	8 239	8 129	1 552	7 1 5
Quilon	2 261	4 013	4 166	8 133
Kottayam (including Trivandrum)	5 115	3,115	1,053	3,015

show that they have gone down in Padmanabhapuram by 2 per cent. during the last three decades, while they have largely increased in the other Divisions, the ratio varying from 63.0 per cent in Quilon to 56.2 per cent. in Kottayam. The marginal statement which apportions to each Division its share of the total number enumerated at each of the last four Censuses confirms these features. Quilon receives the greatest share (40 per cent.) while Trivandrum it has been seen above returns the highest ratio with reference to all the religionists taken together. The steady decrease in the Muhammadan population of the Padmanabhapuram Division is noteworthy. The decline of the Hindus is an equally marked feature of this Division.

Christianity

146 In thirty years, the followers of Christianity have nearly doubled their strength. There are now 903,868 Christians against 498,542 in 1881, the proportional increase being as much as 81·3 per cent. Though the last decade shows a lesser rate of progress as compared with the preceding one, 29·6 per cent against 32·4, the actual addition has been as many as 206,481 persons compared with 170,476 in 1891-1901.

The Eastern Natural Division, which at the 1901 Census showed a lesser rate of growth, has been adding to its numbers more rapidly than the Western, and by augmenting its strength during 1901-1911 by about 15,000 more than the other Division, it is able to show at this Census the same incremental ratio, 29·6 per cent. Unlike the other two religionists, the Christians are more numerous in the Eastern than in the Western Division. The marginal map shows the distribution of Christians as per their ratio to the total population in each Administrative Division. The features revealed are quite unlike those disclosed by the Hindus and the Muhammadans. Padmanabhapuram, which usually takes the last place, now stands second, Kottayam coming first and Trivandrum last. In respect of Trivandrum, it may be said that it has added to

its proportion of 1901 as many as 402 persons during the last ten years, while the addition in the other Divisions is 390 in Padmanabhapuram, 254 in Kottayam and 225 in Quilon.

In every Division, the advance in the strength of the Christian population

Distribution of Christians by Divisions

DIVISION	1911	1901	1891	1881
Total	10,000	10,000	10,000	10,000
Padmanabhapuram	1,292	1,286	1,201	1,547
Trivandrum	855	642	460	551
Quilon	2,904	2,921	3,037	2,787
Kottayam (including Devikulam)	4,949	5,151	5,302	5,165

has been generally progressive. The greatest development has occurred in Trivandrum, where the Christians have increased by as much as 72·8 per cent. The absolute variation has been largest in Kottayam (+88,091). Though Padmanabhapuram shows the smallest actual increase (+27,061), the incremental ratio of 30·2 per cent is greater

than that of Quilon and Kottayam.

147 As at the 1901 Census, a record has been prepared of the sects of Christianity. 355 persons have not stated their sects, while another 116 Christians have returned themselves merely as Protestants. Excluding these, the total Christian population has returned 24 sects, and they have been classified under 15 heads. The classification differs to some extent from that adopted in 1901. For instance, adherents of the London Mission were brought under Minor Denominations in 1901, now they are classed as Congregationalists. Chaldean Syrians, who were included under Syro-Roman, have now been treated under a separate head. Again, all Protestants were put under the heading Anglican Communion at the preceding Census. The majority of persons returned themselves under that sect and was therefore believed to belong to it. This, however, is not the case, and it is seen that many Dissenters

Classification of Christian sects

at working among all classes of the population. It is said, however, that "owing to the fact that Christianity has been more readily accepted by the poorer classes, such as the Arayans, Pulayans, Parayans and Kuravas, who have become Christians in large numbers, more attention and effort have been bestowed on them in recent decades, than upon the classes higher in the social scale. Among the latter, work is conducted by evangelistic and educational agencies, and converts, though comparatively few, have not been wanting."

The converts are not forbidden from observing those social and domestic customs and manners that are not opposed to Christian teaching. Even in regard to customs objectionable from the Christian point of view, adult converts naturally find it difficult to dispense with life-long habits of thought and practice, but it is said that such instances are getting less and less frequent, and are often noticed to be eliminated among the third and fourth generations from the original converts. In cases where converts from different castes reside together in villages or are members of the same local congregation, it is observed that the degree of their mutual social intercourse varies inversely with the number of resident converts from each caste. An individual convert or a single convert family intermingles freely with the other members and also eats with them, and in course of time, intermarriage follows. But where mass movements take place, in which a considerable number of families from two or three different castes become converts and reside in the same locality, they generally refrain from interdining and intermarriage, though they may freely intermingle in general social life. They conduct their public worship together and under the same roof, and those among them, who are qualified, partake together of the sacrament of the "Lord's Supper"*

The London Missionary Society—This Society began its operations in the year 1806, and the first Protestant Church was built in 1809 at Mylaudy in South Travancore. The Mission area is mapped out into 9 Districts. They are given in the margin with the dates of their formation. There are 9 European Missionaries, 21 Indian Ministers, 45 Evangelists, 213 Catechists and 75 Bible women. The educational institutions maintained by the Society number 399, including one College, 13 homes and orphanages for boys and girls, and 46 night schools. The aggregate number of scholars

DISTRICT	When begun
Qadon	1821
Neyoor	1828
Nagercoil	1829
Trivandrum	1835
Pareybnaley	1845
Tittuvelai	1866
Trivandrum (Town)	1891
Attingal	1895
Nedunkulam	1901

under instruction is 17,242, of which 5,059 are girls. Medical relief is an ancient and praiseworthy item in the programme of the London Missionary Society. There are 17 stations where, in the year 1910 to which all the statistics herein given relate, as many as 115,064 patients appear to have been treated.

In regard to the classes amongst which the Mission works, the extent to which their former beliefs and practices are retained, and similar matters bearing on the work of proselytism, it has not been possible to obtain attested first-hand information. However, from the publications of the Society and from direct observation, there seems no reason to suppose that any great difference exists in these respects between this Mission and the one already noticed.

The Salvation Army—The Salvation Army entered Travancore in 1891 and began operations in the south. During the last decade, it has gained considerable accessions to its strength and has been directing its work from the centres of Nagercoil, Trivandrum, Mavelikara and Thuvalla. With an officer styled territorial commander for Travancore, it is guided in respect of general operations from

* From particulars kindly furnished by the O. M. S. Bishop of Travancore and Cochin.

the London Head Quarters. It combines with ordinary religious teaching general educational work and the provision of medical aid. There are four boarding schools and 81 village schools under the control of the Army and the paid workers and employes number as many as 600 of whom 20 are Europeans. The Catherine Booth Hospital at Nagercoil is the most important of the medical institutions and is attracting patients from far and near. The Salvation Army appears to have been also alive to the agricultural and industrial improvement of its followers. It is noted that an industry of drawn thread work and embroidery and pillow lace has recently been established and now employs about two to three hundred women and girls. There is not much to say in regard to the question of intermingling and intermarriage since the converts are practically of two classes the Parayas of the South and the Pulayas of the North. Each class intermarries only within itself. There are no convert villages consisting of more than one distinct caste.

The Yuy mayam sect—It is of comparatively recent origin. Its history and development were noticed at some length in the 1901 Census Report (pages 111-12). Enquiries instituted to ascertain if there are any special features in its growth during the last decade have yielded no results worthy of record. It is not found possible to merge this sect, even for purposes of broad classification, under any of the other sects of Christianity. Even the general term "Protestant" appears a misnomer when applied to the Yuyamayam Christians and from one of the reports received, it is seen that the appellation is even actively resented. The changes which the founder introduced and established in the matter of worship, food, marriage disposal of the dead, etc. are peculiar to this sect. It recognises no higher authority than the family of the founder one of whose brothers is now the high priest. The Old and the New Testaments are documents of equal authority. Its followers have no place of public worship. They marry in their own houses, but unlike the Hindus a register of marriages is maintained by the priest. Their ceremonial benedictions—*asercadams*—are after the fashion of the Brahmans. For further particulars, reference is invited to the report on the 1901 Census. The strength of this sect has continued almost stationary during the last ten years the present number being 1131 souls, as against 1051 in 1901.

100. An examination of Subsidary Table IV shows that of the 399 Europeans in the State by far the largest number belong to the Anglican communion—183 males and 50 females. The Roman Catholic faith claims the next greatest number—107 of which the majority are themselves ministers of religion. Of the 1700 Anglo-Indians, almost the whole number (155) is of the Roman Catholic persuasion. Of the Indian Christians, the largest numbers are found among the Romo-Syrians, Jacobite Syrians and Roman Catholics in successive order.

Animism

101. It was only at the preceding Census that Animism as a form of religious belief was separated from Hinduism and shown as a distinct faith. In dealing with the figures returned in 1901 it was observed that no clear line of demarcation could be drawn between the Animists and the Hindus and that a correct classification of overlapping religions was naturalistic too much for the ordinary Enumerator. The total number recorded as Animist at this Census confirm the truth of that observation. There

now returned 15,773 Animists, as against 28,183 ten years ago, which means a decrease of 12,410 or 44 per cent. A diminution of this kind has been interpreted to mean a process of Hinduization among the Hill tribes. It is perhaps more correct to say that the tendency to seek recognition under the substantive religion of which Animism is believed to be but a phase, is at the bottom of the whole phenomenon.

In view to test the accuracy of the return, however, the schedules were carefully examined in the Tabulation office. The entries were all found correct and it was further seen that the majority of the individuals are named after the Gods of the Hindu theology.

DIVISION	1911	1901
<i>Total</i>	15,773	28,183
Padmanabhapuram	2,039	2,177
Trivandrum	5,439	7,142
Quilon	3,543	15,076
Kottayam (including Devikulam)	4,754	3,789

The marginal statement compares the last two Censuses in respect of persons returned as Animists, and shows that the decline in numbers, noticeable within the decade, stands confined mostly to Quilon. This Division, it is significant to remark, has been recently penetrated by the Railway, and with the development of the planting enterprise, it has been brought into freer commingling with the outer world than heretofore.

General

152 The Census helps *inter alia* to distribute the entire population according to the religions followed by the component members and to arrive at the total number in each. The statistics so compiled have been dealt with, the followers of the several religions compared with one another, and the variations since the previous enumeration noted and explained. Occasion has also been taken to record the sects of Christianity, with their strength and development. The Chapter will be now concluded with a few general remarks on the religious situation and the outlook.

The world is now mixing to an extent undreamt of by the generations of a few centuries ago. The clash of non-religious interests is much in evidence everywhere. Men are losing hold of their ancient moorings, and in the state of our present civilization, it is natural that each should take a cold, calculating and, perhaps, shortsighted view of his relation to the rest of the universe. The progress of physical science and the material grandeur that has resulted from its application in practical life, have shaken faith in the world's religions, especially as the latter have been kept up by hereditary beliefs whose rational bases have been mostly forgotten. Freed from the positive influence of religion, the negative law of individualism is developing the animal nature of man and has been, in every department of life, accepted as the ruling factor. The scientific world has even gone the length of reconstructing religion, sociology and, in a word, every department of knowledge and conduct on the basis of this law, the existence in nature of pure virtue and morality, as preached by religion, has been denied, and the pains and miseries of the "struggle for existence", when not put down as the exaggerated reflex of over-culture on the part of sentiment-ridden man, are declared to be the pre-ordained price of the world's progress.

These features, more or less world-wide, are not inapplicable to India. The introduction of religious education into schools has been seriously suggested as a remedial measure and has been engaging consideration. But it has also been felt that there are practical difficulties of a varied nature. The world's faiths and no-faiths

are more diverse than ever. While many persons affirm the existence of God, there are not wanting persons to deny it. Some feel that God is negotiable direct while others would have a mediator in addition. One creed would start the universe as an ordered cosmos, while another would launch it in chaos. Added to this, there is the fierce struggle for dominance in which each religion puts forward the negative side of all the others and the positive side of its own, a struggle which, if not evenly balanced, cannot be in the interests of truth. There is, again, the critical mind of to-day which would not be satisfied with a creed not "built upon that universal and adamant foundation of all our knowledge reason and direct experience. All the religions of the world, it is said, have been so built. The teachers all saw God they all saw their own souls, and what they saw they preached." And if the claim is now put forward that these experiences are impossible at the present day and that we must take religion wholly on faith, it does not seem likely to be accepted. Testimony is one of the means of proof. But statements accepted on testimony must be such as are capable of being tested and confirmed by subsequent experience. Religious education by dogma and authority must therefore fail and religion, to be accepted and followed, must be a reasonable explanation of the phenomena of life and death of good and evil. In the same way as the attraction of the moon is universally accepted as a reasonable explanation of the tides, or the attraction of the earth of the fall of a leaf or stone."

153 The God-and religion idea rests essentially on a basis of dependence

Basis of the
God and religion idea.

If all the phenomena in the world can be rationally explained and if all the desires of man are capable of immediate fulfilment man would go on his happy round of existence without a single thought of dependence. To take man as having started his career on earth as a savage he begins with no desire other than for food to satisfy his hunger and for clothing to protect him from heat and cold. For a long while he is content with what nature may provide by way of meeting these wants. With the springing of desires, one after another more and more of dependence on self becomes necessary and is exhibited. In all this activity his highest object is the securing of happiness to himself himself being represented by his body with the mind and the five senses. In the attainment of this object, every entity in the animate and the inanimate world is used by him in such manner as may be necessary. When, with his highest flights of conquests over nature he is still confronted with a residuum of unaccomplished desires and thwarted expectations man naturally looks for the consummation outside the seen and the known. God is the name of the entity through or in whom the consummation is sought to be reached or realized and religion is the way.

154 The first conception of the God head may be readily conceived to have

Conceptions of
God head.

been that of a personal being like man, with powers and attributes raised to infinity—the creator protector and destroyer of the universe. Certain difficulties beset this conception. Whence came the primordial materials for the building of the Cosmos unless they were all in Himself? If omnipresence is the distinguishing feature of the ultimate cause how can two, i. e., Himself and the universe-material, exist in the same space?

The very champion says Croder in his "Civilization and Progress," "so much that religion is matter of faith, have not faith enough in their schemes to have it without comment, leaving that, being matter of faith it was require no proof. On the contrary they have filled the libraries with their bulky tomes, written to prove that their particular scheme has its analogies in nature and is in harmony with the laws of the mind and of human life. And had it this but asking you to accept it, not by faith, but because it is intellectually credible?"

! The authority of testimony is referred to as abridgementary by the Hinduologists.

Further, with a universe absolutely subject to His creation and control, how can there be any responsibility for acts and omissions? If, in the absence of such responsibility, any evil should appear, would it not be taken to mean that He willed it, with the knowledge implied in his omniscience that that willing means pain and suffering to his subject creatures? He may not have deserved it and hence has no reason to expect it, but it may be His inscrutable will and pleasure to so ordain. The theory that progressive perfection of the universe through pain and suffering is the pre-ordained Divine law may, it is said, be connected with the influence, though unconscious, of such a conception of the God-head. Attempts are not, however, wanting in the history of religions to dissociate all evil from God who, by way of distinction from a God of evil, is called the God of good. Provision is also found for entreaties being offered up at appointed times and places, that the influence of the God of good may be exerted so as to prevail over that of the evil One. But the difficulty of explaining how the evil power came into being, whether from, or in the face of, an all-powerful, all-good God, and how, in spite of scriptural texts and innate probabilities, the God of good, as far as effects are yet visible, is less powerful than the other, disconcerts the enquirer. He is then led on to the next conception, which hinges upon the endowment of free-will to man, and on its use and misuse determining his happiness and misery. But the possession of authority to exercise a will in the proper direction is not the same as being able to exercise it, and as the latter depends upon the conditions under which it has to be exercised, the question is asked in respect of cases of misuse, why should He create such conditions as would tempt or necessitate that misuse? If it is to be said that the conditions too, either of equipment or of working, were not established by God but by man himself, it amounts practically to the total negation of the divine. This idea of a personal being as the highest existence and ultimate cause is, however, gradually given up in favour of an immanent, all-pervading divine presence, although the unconscious effect of the old belief may occasionally still persist in the inability to recognise that divinity could pervade an idol or image. But as two cannot exist in the same space, God is still an extra-cosmic being. The change of conception therefore does not alter the situation.

At this stage in the evolution of the religious idea comes in the use of moral laws as propounded for the guidance of man. But moral laws are not divine commands, in the sense of being, like the laws of nature, inviolate. Thrown wholly on his own resources in the matter of his happiness and misery, at least in the seen life of this world, man has to enact such laws in the interests of the entire race. But what is the basis of these laws? Are they to be of universal application? What does a powerful man lose, if he takes away the property of his weak neighbour? Where is the chance of progress through evolution, if every weakness is to be tolerated and jealously preserved? If, against this kind of argument, it is said that moral laws represent God's commands, and that their violation, though possible to man unlike the laws of nature, must be at his peril both in this life and in the next, it is asked in honest bluntness, "why should I be created strong and he weak, and what is more, so placed as to feel prompted by necessity to live and progress at his expense?" If it is urged again, though in a pointless fashion, "argue however you will, breach of moral laws is sinful," the reply is readily given in words such as these—"The abstract ideals of religion cannot dominate all the relations of life in this world. I do charity to the poor and the infirm, I give donations to temple, church and mosque and make prayers

and offerings. All this must secure for me happiness in the next world. As for the present, I will take care of myself." But as the mystery of pain in the universe remains unsolved, persons are not wanting who more through sentiment than reason, feel that, in the activity of this world, sins may be committed and that these sins probably account for the pains and disappointments. They therefore feel penitent and pray for forgiveness. This prayer is carried on in spite of the fact, that consistently with the plan of creation with a free-will, God can only give a deaf ear to man's prayers. Thus then, the absolute powers and qualities, including creation, protection and destruction, through which pain in the universe could, it was hoped, be obviated or remedied, find, under the theory of free-will, no room for exercise.

153. If the persistence of sin and pain even under the absolute lordship of an extra-cosmic God with or without free-will to man, should incline one to atheism, the insufficiency of physical science theories to account for the origin and orderly evolution of the universe makes the positing of a great purposive power unavoidable. Now a legitimate presumption suggests itself that God, in his impartiality gave free-will, as represented by the power of action and reaction, not only to man or to one section of mankind, but to every entity in existence, and thus made the universe a self-contained whole for all purposes of initiative and adjustment, and responsible to itself for the effects. The trend of modern thought is towards recognising that, as every thing exists in consciousness, no substance is blind or devoid of the power of reaction. With the universe as an inter-connected whole or a gigantic organism the application of the moral laws can alone secure the right action and reaction † They therefore stand justified in reason and experience. Only the way to be followed has to be known and made easy. If that is done, there can be no untoward happenings at home or outside. Even the great cataclysms of nature, accepted in sullen resignation as acts of God, can it is claimed, be avoided. But, where is the place of God with reference to this self-contained universe? The extra-cosmic view of divinity transcendental or immanent, does not, it has been seen, satisfy. The intra-cosmic view or the view that God and the universe are identical, alone remains. According to it, the universe would be but a form or manifestation of God, who is its material as well as its efficient cause. He alone exists. Hence is his omnipresence. There is nothing else to know him. He is therefore unknowable. This is *not* pantheism, in the sense that God is only nature as we see it. But, it is pantheism, in the sense that nature is nothing but God. It is *not* pan-cosmism, in the sense that God exists only as realized in the cosmos. But, it is pan-cosmism, in the sense that the cosmos exists only as a manifestation of God. Now to speak of God as having manifested himself evidently through a change in his substance, may seem strange. But, as will be shown later on, the highest and only Existence undergoes no change. But, even otherwise with God as the great cause of all, there is nothing else for the universe to be made out of. Again, he must separate himself into parts by space else there would be no activity. Mere separation in space would not secure any discriminateness in that activity. There must be for that purpose differentiation through structure. With nothing else in existence than these differentiated manifestations, there can be no space in the sense of absolute

† Further one of the most original and influential thinkers in modern days, the whole universe is, he declares, living being in its up of parts themselves living. "Consciousness," says Bergson, "is, in principle, present in all living matter but it is dormant or sleeping, wherever such matter remains quiescent activity."

‡ All time says Emerson, is mathematically just, as much as the true side of an algebraic equation. To apply another parallelism of his, the absolute balance of give and take is certainly not more true in the affairs of judges than in the action and reaction of nature.

vacuity What is so regarded is only a tenuous form of the divine, through which denser forms move, like fish in water This process of self-manifestation is the result of his willing it In other words, thought is the first law of creation Whoever asks why all this manifestation in space and form, only questions himself, thinking that separate entities exist in seemingly separate bodies

In this view, the universe, it may be recognised, has passed through a number of successive stages In the first stage, the universe exists in the mind of God as one and undifferentiated like the plant within the seed In the next, the universe showed separation of parts and differentiation through structure The separation into parts is the creation of a number of entities The differentiation into structure is the combination of the primal elements or elemental forces, lying dormant in the mind of God, in an endless variety of number and proportion Thus is produced an infinite number of entities, each with a name and form, enabled to lead a life of interdependence—in other words, the organismal universe But every such entity retained consciousness of its divine substance and of the real oneness of the universe with itself Only universal thoughts, words, and deeds existed, only co-operative forces played their part—love, mercy, righteousness &c,—and all for one's own sake There was then kept up an equilibrium in the perception of the unmanifested and manifested forms. But manifestation being essentially a process of suppressing what is real and expressing what is assumed, the continued perception of the latter must naturally mean the ever lessening consciousness of the former, the rapidity and the extent varying with the grossness of the structure with which each entity started on its career By way of provision against this necessary result, as it were, the universe was launched with certain fixed laws, which would not allow transgression of the bonds of oneness, at the pain of reaction The highest scriptures of the world constitute their record and reminder. But the progressive dimming of the sense of oneness brings on, through the influence of habit, the stage of dualism in the universe. Here, man feels that God is the lord of the universe and is in reality and substance entirely different from him In the beginning, this dualism must be of a convergent kind, with concordant thoughts, words and deeds Although, in this stage, unlike in the previous one, each entity would not represent the law, there would be the strictest adherence to it, and each in its own line would work with the definite end and aim of falling in with the current of unity, to which the universe after the manifestation must, again, be involving This was ensured in India, it is believed, through the caste or professional system with equality of rights In addition to the indissoluble internal connection, an external connection was established as well, among the entities in the diverse-looking world, through the link of mutual service Like the cosmos in nature, with its elaborately differentiated arrangements and inexorable laws, a cosmos was set up in society too, with similar arrangements and laws, and the principle of action and reaction was consciously and discriminately applied. In regard to the invisible power or powers believed to influence the world, though cognisable only through a separate, psychic sense, a similar system of barter existed in the form of rituals and prayers. In the social system, the labour bartered is concrete In the other, it is the abstract labour of prayer that is bartered With God, thus, as the material as well as the efficient cause of the universe, seen and unseen, his dominion is represented in the life of that universe by the laws of nature, of its action and reaction, and in the sense in which natural laws are beneficent when acted in accordance therewith, and malefic when defied, the all-goodness and the all-severity of God stand reconciled Viewed in reference to these stages, the world may now be said to be in the stage of "divergent dualism."

self as individual self, class self national self or human self and latterly sex self is, in differing form, the centre and guide of all activities. The interests of every other unit, individual or corporate is subordinated to the unit of self instead of the unit of self being subordinated to or rather co-ordinated with the others. India has forgotten the aim and purpose of the caste system. Struggle for each one's existence has come to be regarded, throughout the world, as the most scientific way of getting on, and progress, which is its name is recognised as quite a modern institution, deserving to take the place of the old world static order. But, when the cosmic law is disobeyed, its sanctions must operate all the same. God, as representing the result of co-operative action, prompts him that does good to do further good and be happy: the God of evil representing the reaction that flows from evil thoughts, words and deeds tempts the evil person to further evils and saddens his life.*

156. In connection with the theory of intra-cosmic religion, the question may arise, if the universe is the manifested or changed form of God, does He retain a separate, unchanged existence? It is answered Yes and it is added that He as the cognizer and the only cognizer of this manifested universe stands apart and separate from it. But this does not mean that there are two existences. As He is the only knower the universe as a whole exists only to Him. Here in stance the phenomena of the dream state which exists only to the dreamer. The monistic position is that the universe is in ultimate truth the great dream of God. Although unlike that of man, it is an intent and purposive process, it is no less the product of the mind and has no existence outside Him, though for all purposes of human conception and action, the universe is real and must be taken to be a changed form of the Great Cause. When therefore He does not cognize the universe the universe disappears or gets involuted in Him, just as, after the cessation of dreams in the ordinary individual all consciousness of things vanishes into a state of dormancy. This is His sleep. And as there is a waking after this dormancy for the average man, the universe re-appears to God when He next awakes and wills it.

These are all according to the testimony of the realized seers, experiences within the ken of the inner vision, which is acquired by mind-concentration and to which the entire manifested existence unfolds itself in due course of psychic development. He who believes that the creator is different from his created things or that the creator is unconscious (or pure dream) can only wish to be enabled through this means, to realize his position on the manifested plane and be happy in that realization. He will be ever content with the name and form with which he was created but which it was stated, were only assumed for discriminative activity in the universe and hence have no place in the highest state of involution or rest that may be attained to. He who believes that his first beginning was in the separation of the divine substance in space to which structure in infinite differentiation was added from a material outside himself for the purpose aforesaid, is the holder of a justified belief in the Oneness of God and the universe. Such an individual can only hope to throw off the structure no more needed for a state of non-activity and to realize his substantial divinity but cannot venture to think that once separated, he can be one with the parent stock of the divine any more. He too therefore does not aim at a state prior to that of manifestation but is content

* This law, that the sum-total of every good and evil in the individual has "its fit" will be made clear by the fact that if a man's karma is good, he will be born in a good family, and if his karma is evil, he will be born in a bad family. If the karma is good, he will be born in a good family.

with the realization of what he considers his actual place on the manifested plane. But, he who is convinced that the separation in space, which was the initial step in manifestation, and the subsequent differentiation of structure were, none of them, real but the mere results of a thought-process, analogous to the phenomena of the ordinary dream, *i. e.*, an intra-cosmic religionist, pure and entire, would not stop short of throwing off both the name (separateness) and form (differentiation), which really make up the universe *. And he, as a separate entity, being but that name and form, what would remain, when they are thrown off, is only the cognizing Divine self which he naturally aims at realizing himself to be. But when he works up further and oversteps this cognition within himself of the manifested universe, he finds himself in a state of absorption in self or divine sleep. This evidently differs from the absorption that succeeds the dream-state of the ordinary sleeper, in that the former is passed into with a clear continuity of consciousness, while the latter is a case of "a sleep and a forgetting." This is the highest goal of religion that is conceivable. But he who has reached this stage may, it is said, advance a step still further and attain the state of what is called 'absolute consciousness' which, from the nature of things, the finite intellect cannot comprehend—where all relativity, even the relation of self, is abolished. For that purpose, he has to blot out the universe altogether, even in its involuted germ-state, by destroying the mind or mirror in which the dream of the universe is reflected. The recurrence of a future manifestation to his consciousness then becomes impossible. This is the sleep that knows no waking—in existence-knowledge-bliss—the final rest which the highest adepts are believed to enter at their severance from the phenomenal world.

The question may be asked again, whence comes this mind, if it is such a separate, abolishable entity? How did it exist in the same space with the omnipresent God? Whereto can it ever go if dissolved, as it must go somewhere under nature's law of conservation? This is a summons to the monist to make his final declaration that the mirror of the mind is nothing else than the idea of non-existence (of any other than himself), and that the idea of such non-existence is the only thing that can co-exist in the same space with the idea of one absolute existence. But an image from a non-existent mirror, must be non-existent, and the universe could never have been manifest. How then is a non-existent thing to be cognized? It is done, it is said, in the manner in which we, going to sleep with our mind fixed on an *idea*, gradually lose ourselves in it in the dream state and cognize *it* only, to the suppression of the *realities* with which we started, such as body, bed, etc. But it is not real, even though cognized. No less possible is the cognition of the idea of non-existence or mind on the part of the great and ultimate God. And all this follows naturally upon the axiomatic necessity that redemption from a positive state, which is one of cognition, can only come when the existence cognized can be and has been traced up to a state of its own negation, in other words, final emancipation of an entity consists, as it must, in the realization of its non-existence as such entity by absorption into the one real and absolute Existence. "If we take religion as *saving* help," says Professor Rhys Davids, "no worshipper possesses religion in full security, until he has gone straight to the fountain-head and gained the God of Gods" †

* Truly did Shakespeare speak when he put into the mouth of Prospero, the pregnant words —

"We are such stuff
As dreams are made of"

† Fawcett, in his "Riddle of the Universe", refers to this great and ultimate God as the God of absolutism as contrasted with the "Gods of the theologians" who are really his finer manifestations.

These are the cardinal facts of the position to which the enquirer is led up and which, in respect of its fundament, is open to verification through the psychio process of self experience. And as it is seen to stand the test of reasoned discussion better than any other and could be made to go a considerable way towards reconciling the diverse ecclesiastical religions of the world, it may well form the ground work of a secular religion.

157 The practice of concentration, through which the goal of religion

The goal of religion
with reference to the
tendencies of the age.

has to be reached, is, it may be remarked, not a simple one to be undertaken lightly and without sufficient previous preparation. A sense of unity in the Great Cause on which

the seeking after reunion proceeds, must, when translated into action, mean in the first instance, the not doing of harm to any in or connected with, that cause. This may be brought about in two ways in respect of the average man. The one will be a recognition that the universe is a kind of family and that each member is a sharer in the fortunes of that family and of every member in it. The other will be a conviction that, though not related to the Lord of the universe like children to their *pater familias* all are subjects of a just and wise Divine government. In all these cases, there should be not only a system of profits and losses, or rewards and punishments as the case may be but such a disposition of society that trespasses will not take place. In other words, there should be set up in the world a social cosmos with rights, duties and concessions for each family and class established like the cosmos of nature and with the fixity of her arrangement and presumably therefore with the assurance of a like stability. A superstructure of religiousness in the world cannot be reared on a continually shifting economic basis, any more than spirituality in the individual can grow or thrive when his bodily organs are in the throes of acute disorder and struggle. How can one neglect the demands of this world, from which he has to conceive the other world, to pass eventually to the world of freedom? But science is understood to sing a different tune. Darwin's researches and speculations, at the beginning of the 19th Century would appear to show that the struggle for existence and the continued elimination of the unfit is the law among the animal world and that the progress and development of human society may and should follow these lines of competition and free selection. This accords neither with the family or the stat conception of the universe nor with the conception of civilized society based on the essential difference between man and brute nor with the biological conception of the organism. Like every thing else the law of rivalry and selection has its use and misuse. Its use was in the adjustment of organ to function, so that the organism may be fully formed. But if an organizing process once begun should be completed, or if an already formed organism should be maintained and developed, continuity of function through heredity is the method. The struggle should be each in co-ordination with and for the sake of every other† and not *against* every other. This is the basic idea

The five are still faithful to the aim,
Their blood preserved.
The seven are faithful to the end
That worketh in the end
And to the end it goes, there
Is every fibre true.
Close clasp earth's flesh, her neck
Through reason's skill to fall.
And clasp them all
To the end that leads the way
If we all follow!

(W. Whitwell)

As we were with

† It is an error to suppose that the death of one is the death of the other, however alive he can be. It is a fact that the death of one is the death of the other, but the survival of the fittest is not the survival of the fittest. It is a fact that the death of one is the death of the other, but the survival of the fittest is not the survival of the fittest. It is a fact that the death of one is the death of the other, but the survival of the fittest is not the survival of the fittest.

of function or service. The misuse of the law, which consists in continuing and applying it at all times without any organismal idea, is what Darwinism however has come to mean in the actual life of the people. The question is whether, with such a mis-apprehension in the minds of men, a sense of true brotherhood can ever be a guiding or an easily realizable ideal. "We are told," says Balfour, "that learning is only valuable if it helps man in the struggle for life. But if that is ever believed, * * * our civilization will become only an elaborately organized barbarism. Universities rose into power and flourished in splendour because their business was to help, not the individual in his struggle for life, but the world in its effort to rise above the struggle for life." Arnold Toynbee says "the effects of the industrial revolution prove that free competition may produce wealth without well-being." If, in a country where hand-labour once prevailed, machine labour is introduced, and worked so as to afford occupation to all the industrial labourers already employed and their increasing progeny, it means an amount of production which must compel export, whatever be the effect on the fellow industrials of other countries. When all the nations work out such an industrial system, they must all suffer from surfeit of output, and must, as the merest act of self-preservation, try to barter their goods in other countries than their own. The uncertainty of outlets abroad reacts on the regularity and wages of employment at home, and gives rise to all the horrors of poverty and crime in the midst of opulence and refinement, to unions and counter-unions, strikes and lock-outs and to the anarchist and anti-social developments of the so-called socialistic activity one hears of in the civilized countries of the world. On this account is kept up, personal cordialities and social amenities notwithstanding, a breathless state of preparedness for war between one industrial nation and another and an all-pervading atmosphere of suspicion and distrust. "*Timeo danaos et dona ferentes*—I fear the Greeks, even while bringing gifts".

158 The growing recognition of this crisis in the life, especially of the West, has led to direct and impassioned appeals to religion, and the Church there does not seem unwilling to respond. * A contrary note is also heard † There is also the cry of irreligion. ‡ It is said that the church-pews are getting empty, and in it is seen one of the tangible signs of the loosening of the hold of religion on men's minds || Others repudiate any connexion between the

* At the last session of the Congregational union held in Nottingham, a resolution was passed recording "the conviction of the assembly that the causes of the wide-spread conflict between capital and labour are moral as well as economic and can only be satisfactorily dealt with by the thorough going application of the laws of Christ to the commercial and industrial life of the country. They went further and instructed the social service committee "to convene a conference of such leaders of commerce, manufacture and labour as are congregationalists, to consider the duty of the congregational churches in view of the present disturbed state of affairs and prepare a statement setting forth methods by which the congregational churches may contribute to the permanent establishment of good-will and peace."

† Writing the other day in the North American Review for January 1912, Rear Admiral A. T. Mahan under the heading "The place of force in international relations" says "when the church, as church, interferes, with the state as state, whether in men's thoughts or in their acts, evil follows. The people of the United States scarcely realize what a potent political agency a church may be made, and the christian church scarcely realizes the injury it will do itself by diverting any of its none too great activity from spiritual instruction to political agitation."

‡ "To Christian, England" says Bernard Lucas in his Empire of Christ "a pound is hardly what a penny was a century ago, but to the England of to-day, Christianity does not occupy the position of influence it occupied a century ago. An expansion in the influence of Christianity abroad, a contraction of its influence at home. The vitality of the Church is at a low ebb, her pulse is both slow and feeble."

|| "New York on Sunday presents the aspects of a pagan city, and the same is even more true of Chicago and San Francisco and our own London! Any one who watches in Church hours its mighty stream of life moving hither by road and rail, by motor and tram or on foot, to the links, to the tennis court, to the open, to the sea, or in-doors to the cinematograph show—any whither but to the Church door—has evidence enough of what is going on. The congregation is more and more that of the parents, less and less that of their children. If the movement of the last twenty years goes on for another twenty years, and it promises to go on with an increasing velocity—what shall we have in London, and England, plainly in England and the world? We are up against a big question for our existing Christianity."—J. B. in the Christian world

or competitive separatism has reached even the primeval institution of sex-differentiation, and a hostile feminine consciousness, kindled and fed by economic necessity or, more plainly, unemployment in accordance with nature's design, is threatening to infect the family compact, the last and the most universal feature of the human animal.

159 The features just outlined yet apply only to the West in any noticeable measure. But as the West is now the teacher and exemplar of the world, her society and its religious consciousness may be taken as the embodiment of the motive forces of the day. What at this moment is the sentiment or opinion of the Westerner is, or will soon be, that of the rest of human kind. The happy ordering of his affairs is therefore of the first importance. The universal struggle for existence among civilized nations is, however, gradually unfolding the divine sense of human oneness and international arbitrations and compacts have been a noticeable feature in latter-day politics. But this must be changed into a universal compact among all the nations of the world in the form of mutual dependence for certain natural and artificial needs, each nation being divided into a number of sections mutually dependent, else, sectional compacts, based purely on love and good fellowship, must needs be inconstant. The conscience of the best thinkers of the day points in that direction. The higher exponents of Christianity, the dominant religion of the world, are warring against inequality and strife. The task of reconciling the interests of self, individual or corporate, with the interests of other-selves, is, no doubt, herculean, especially in an age of confirmed divergent dualism. But it will have to be faced, and the direction of activities given a sharp turn, if matters should not get more involved. If it is difficult to do the right, what is easy it cannot be right to do. It is no use to affect an air of expectant optimism in the midst of acute disorder and to look forward on the strength of pseudo-science to a state of "all-rightness" in the end. Convulsion, especially in the adult, do not lead to the restfulness of health, but are usually associated with coma and death. Further, the too well-known terms, 'impossible' and 'impracticable' are relative in their significance. What may resist a given amount of effort may yield to a greater out-put. And as the history of the world has amply shown, those who would drown a casual voice of cheer with their wails of impotence, either seriously and sympathetically or flippantly and irresponsibly, do not count in the long run. Food is the primary want of man, but for the universal prevalence of this want, there would be no activity in the world at all. And, in the seeking of its satisfaction, the universal or positive side should not be neglected. For this purpose, socio-economic life should be guided along the lines of convergent dualism, as was attempted to be indicated *supra*. Unless that is done, no scheme of education in classic ideals nor exhortation from press, pulpit or platform, can prevent unreligion or anti-socialness, and a true sense of brotherhood, even within the smallest compass, cannot grow. Oneness of substance or oneness of origin merely, according as the intra-cosmic or the extra-cosmic view of religion is accepted, will have no chance of being realized as underlying the seen manyness in the universe, and with a persisting feeling of manyness, the mind and the senses must needs clog the wheels of all higher religious practice and make concentration of mind, whose completion alone means the opening out of the inner vision, impossible. What therefore generates, rationalizes, enforces and finally establishes this brotherhood, will alone secure for man the goal of religion and command his intelligent and abiding acceptance. Such a religion would reconcile and strengthen, in their respective places, the varying faiths of the world, and make them co-workers in the spiritual redemption of humanity. With

science harnessed to its service it would make the strong as well as the weak, happy and free and enable the several classes in a nation and the several nations of mankind to consciously and discriminately fall into line with the scheme of cosmic order and to be assured of a stable and continued existence like the universe of which they form so many integral parts. * And on the extent to which the institution of religion fulfils and assists all this vast function would depend its actual place in the pantheon of the world's forces.

Death is, of course, inevitable for the generations in a nation, as of individuals in a family. But nations need not die any more than that family should become extinct. "The theory of the decay of nations," says J.B. in the Christian world "is offered as a law as smouldering inevitable, as part of the cosmic order. But are we sure that there is law here? We take leave to doubt it. When we study the ancient states, we can see reasons for their fall. Such is it by no means necessary to should repeat. We are studying as never before the economic, the physical, the social, the mental conditions which relate to the existence and progress of men and of nations. It is safe to say that we shall live in proportion as we know and practice the laws of life. And so, speaking generally to the degree in which we surpass antiquity in our grasp of those laws, to that degree do we pass out of the extinction which prelude their decay.

SUBSIDIARY TABLE I—General distribution of the population by religion

(including Animists), Christians and Musalmans

CHAPTER XI.

CASTE, TRIBE AND RACE

(TABLES XIII & XIII)

Statistical

160 Table XIII shows the distribution of the entire population by caste, tribe, race or nationality. The religions are shown separately, and the arrangement of the castes, tribes &c, under each religion is alphabetical. At the 1901 Census, every one of the castes returned was shown in the main Table and the total strength entered against it. It was suggested for this Census that castes that are of no general interest and which, in 1901, formed less than one per thousand of the total population, might be omitted. But a strict adherence to a criterion of numerical proportion would, it was feared, result in the omission of a number of local castes otherwise important and interesting. It was therefore decided to take in for the main Table all castes about 1,000 strong, and in respect of the remaining castes included under 'others' in these Tables, to prepare and annex a detailed statement (Table XIII). In all, 232 castes, tribes and races have been returned of which the details are shown in the main Table in respect of 87. Two Subsidiary Tables have been appended to this Chapter.

Subsidiary Table I—Showing the castes classified according to their traditional occupations

Subsidiary Table II—Giving the variation in strength since 1901

161 A word may be said in regard to the accuracy of the return. Wrong entries may be due, either to ignorance or to deliberate mis-statement. Where the members of one caste describe themselves by the name of some other caste in the supposition that the latter is higher in the social scale, or where they assume a new name which is not that of an existing caste, there may be room for wrong entries. But, for the sake of avoiding errors, the name of the caste-subdivision was directed to be entered below the caste-name. This instruction was duly carried out, and the information thus recorded enabled the Tabulation Office to find out the real caste-name in cases of doubt. A few names were returned which baffled identification. But from the care bestowed in tabulation and compilation, it may safely be said that Table XIII embodies an accurate record.

162 In 1891, the classification of castes was based on functional and ethnological considerations. In 1901, a classification by social precedence was prescribed for British India and suggested to be adopted in Travancore. The point was fully gone into in the 1901 Report (*vide* para 198) and the conclusion arrived at was, that from the stand-point of either scientific accuracy or public policy, the formulation of a scale of social precedence for the Travancore castes was unnecessary and undesirable. The arrangement adopted at that Census was, therefore, alphabetical. It was thus a modification of what was followed elsewhere. At this Census, however, it was decided even by the British Indian authorities that the question of social precedence was to be laid aside, and that a Subsidiary Table should be annexed to the

Caste Chapter in which the castes should be grouped according to their traditional occupations. This has been done here to

163 To the scientific student as well as to the would be repairer of the Indian social edifice the subject of caste is of great interest and value. The field of ethnographic enquiry however, has been well ploughed and so far as Travancore is concerned, the main castes were attempted to be fully described in the 1901 Census Report. The accounts therein published of the Nāyars and the Izhavas, who together form one-half of the total Hindu population have been adopted in the "Ethnographic Appendices" to the All India Census Report. In regard to several other castes, information was collected and furnished by the writer to the Officer in charge of the Ethnographic Survey of the Madras Presidency who has incorporated the same in his "Castes and Tribes of Southern India." By way of furnishing an outline reference for the castes returned at the Census, a glossary is appended.

Even in the face of all existing knowledge the subject of caste appears to elude all grasp when one attempts to trace its principle and constitution and unless they are unravelled and presented in their true light, the problem cannot be taken as solved. The centurian vicissitudes of India's fortunes have obscured the foundations on which her social system was built up and a mere examination of the incrustations which have attached themselves during a long period of social drifting cannot greatly help. Numerous theories have been propounded in regard to the origin of caste and it has been remarked with as much point as truth that

it is not likely that any useful purpose would be served by further theorising. The quest is, however still for further descriptive particulars. The writer on caste in the latest edition of the *Encyclopædia Britannica* observes—"How far intermarriage is permitted what are the effects of a marriage permitted but looked on as irregular what are the penalties for a marriage forbidden, whether the rules protecting trades and occupations are in effect more than a kind of unionism grown inveterate through custom, by what means caste is lost and in what circumstances it can be regained—these are subjects regarding which very little real or definite knowledge exists. But the structure of caste which totals up in one word all these ethnographic details is fast crumbling and has in fact but an archaeological interest. The main point for enquiry is how and why such a system as caste—unique in the world alike in its nature and its tenacity—came to be reared in India what kind of permanence it is intended to impart to the arrangement of human relations what part the system *exercised as a whole* has to play in a settled society and what place the distinctiveness of caste structure the subject matter of ethnography fills in the life of the Indian people. An attempt is made on these lines in the succeeding paras of this Chapter. But before doing so the statistics of castes may be referred to.

164 Subsidiary Table II gives the strength and notes the variation since the last Census, of the castes that form two per mille of the total population. Of the 31 castes therein entered, the castes with the greatest numerical strength are the Nayar (592,480) and the Izhava (510,260). Next come a long way off the Pulaya (16,114) and the Chānnan (166,195). All the other castes number less than one hundred thousand. Since 1901 the *Lullu* the *Chetti* and the *Mannan* have grown the most, the percentages of increase being respectively 31.7, 27.0 and 27.8. The Brahman the Marakkān the *Ampannan* the *Konkani* and the *Kannian* have advanced more than 20 per cent during the last decennium. The castes which have advanced very little or have

retrogressed are the Chānnān (+ 6 per cent) the Vellāla (+1 per cent) the Paraya (+ 8 per cent) and the Pulaya (—10·3 per cent). Probably the Vellāla community mostly confined to the Padmanabhapuram Division and especially to the two southern taluks reflect in detail the very slow advance which the Division itself and the two taluks in particular have evinced, as compared with the other administrative units. Further, the community is composed of makkathayees and manu-makkathayees and it is not unlikely that some of the latter have gone under the 'Nāyār' head. A diagram is appended to this Chapter, showing the main castes arranged in the order of numerical strength. The castes have been classified by traditional occupation and entered in Subsidiary Table I. It shows, as is to be expected, that the agricultural castes predominate. They aggregate and form 29·6 per cent of the total Hindu population and 19·7 per cent of the entire population of the State.

165 The distribution by race of the Muhammadan population is given in
 Muhammadans Table XIII, Part B. The number of Muhammadans returned at this Census is 226,617 and forms 6·6 per cent of the total population. Compared with the previous Census, they have advanced by 18·9 per cent. The three chief divisions—Jonakan, Mēttan and Tulukkan—have returned more than 50,000 persons each. The first, numbering in all 57,031, is found in all the Divisions except Padmanabhapuram and are most numerous in Kottayam. In 1901, the number of Jonakans recorded was 48,026. Of the 66,864 Mēttans returned, the Quilon Division contains the largest number, 47,615. Their strength has increased by 11,650 during the last decade. The total number of Tulukkans recorded at this Census is 61,095, as against 52,206 in 1901. They have been largely returned from the Trivandrum and Quilon Divisions, 20,841 and 22,192 respectively. The Rivuttans who form an allied division number 1,202 and are chiefly found in the Kottayam Division.

166 The distribution of the Christian population into (1) Indian Christians,
 Christians (2) Anglo-Indians and (3) Europeans and allied races, is shown in Table XIII, Part C. Table XVIII distributes the last two according to the ages returned. It may be noted here that the term, Indian Christian, is used to denote those who have hitherto been designated as Native Christian and the term, Anglo Indian, is used in the place of Eurasian.

Of the total Christian population of 903,868, as many as 901,719 have been returned as Indian Christians, which gives a percentage of 99·7 on the whole. The largest number—128,527—is found in the Kottayam Division and the smallest number, 18,131, in Devikulam.

Of the 1,750 Anglo-Indians, as many as 817 are in the Trivandrum Division. Compared with the previous Census, they show an increase of 261 persons or 17·5 per cent. 857 are between the ages of 15 and 50. The number of male children under 12 years of age is 256 and that of female, one less. Above the age of 50, there are 102 men and 84 women.

The number of Europeans and allied races returned at the Census was 399—250 males and 149 females—as against 534 in 1901. 320 are natives of the British Isles and 79 have come from other European countries. Of the former, 152 reside in the Devikulam Division, 59 in Quilon and 68 in Trivandrum. The total number of Britishers between the ages of 15 and 50 is 253. There are only 38 children below the age of 12, 20 of whom are males and 18 females. There are 19 males and 8 females above the age of 50.

General Remarks

167 Distinctions in society arise in two ways—(a) through difference in occupation and (b) through difference in wealth and refinement.

A foreword.

But however caused, distinctions found in a progressing nation are taken as conducing to progress, while those of a retrogressing nation are believed to be the cause of its retrogression. This is the first tendency of the human mind, that has to be remembered in dealing with the caste question, which, though before the modern public mind for centuries, is still considered to have been not yet satisfactorily understood. On account of this tendency the mind sees only one side, the bright side of the institutions of the societies now progressing and the dark side of those found among nations low in the scale of modern civilization. The result naturally is a too hasty substitution of the former for the latter only to be replaced by something else when, through insufficient understanding and consequent neglect of the conditions that determine its good and evil its evil side asserts itself. This disregard of determining conditions accounts also for the neglect of the circumstance, that what holds good to one individual or society under certain condition of time and place is not necessarily so under all conditions. A third and allied fallacy in thought consists in putting down good and evil as inherent and eternal, i.e. independent of conditions, in the matter of both origin and remedy. The misreading of evolution as the change from evil to good instead of from efficient to more efficient and from disorder to order instead of from simple to complex, starts the enquirer with the fixed idea that the world was at its worst in every way and will be, though never is, at its best. This conception of "progress" without a definite goal or ideal disposition of affairs to progress to, and to remain in often misdirects human endeavour and blurs the vision. This is the fourth error in thought that may well be guarded against. The tendency to accept opinions without the investigation of even the main grounds, and to judge of the circumstances and motives of all men in the light of one's own or other habits of mind, whose effects it is difficult to exaggerate. But what is perhaps most prominently visible, even to the superficial observer is, how in spite of all assertions of man's free-will he is a slave to circumstances. He may have created them himself. But having once done so, he is no more free than a parrot in a cage. No nations in the world's history ever loved to live in peace and harmony more than they do now but how true is it that all courtesies and amenities notwithstanding they are enveloped in an atmosphere of distrust and militarism. The fact is that the past determines the present and both determine the future be it of individuals or of nations. And these—platitudes though they may be to those who are constantly mindful of them—should be ever kept in view by all students of society if in the understanding of its past or in the appraising of its present, they do not wish to go astray.

168. Caste has been described by a French writer as a system of social ar-

The real and the
adventitious in
caste.

range ment characterized by (a) hereditary specialization (b) unequal distribution of rights, and (c) cleavage into a number of water tight compartments. This is not an inaccurate presentment of caste as it now is. While hereditary specialization may be defensible in equality of rights will not be long permitted. And the circumstance that a system of mutually exclusive social groupings precludes even any attempt to equalize makes the situation intolerable. It is no doubt true that the object of this compartmental formation viewed in respect of occupational distinctiveness, is to estab-

blish labour division by families and maintain it for all time, without mutual encroachment or fear of such encroachment. Society would thereby be saved the stress, the strain and the insecurity involved in the choice of profession for each individual, and the service itself will grow in efficiency with each generation of workers. For all this, however, inequality of rights would be too dear a price to pay. In the study of caste, the pivotal point, therefore, is whether such inequality is of its essence. If so, the institution has no right to resist the modern disintegrating influences. Sat upon as it now is by the almost entire public opinion of the world, these influences must soon destroy its last vestige, and one cannot worse employ his time and energy than in trying to unravel its birth and past life-history. If, however, inequality is not of its essence, nor even a pardonable feature in the eyes of its founders or of its thinking adherents, an enquiry into its principles and practice would be a profitable study, as of a diseased individual for the sake of preserving him with the disease cured, and may even offer lessons to the outside world.

As was observed in the Chapter on Religion, para 155 *supra*, the belief in a conscious purposive entity at the back of the universe is inevitable, and the view that this universe is the totality of His innumerable manifested forms, appeared to accord more than any other with reason and self-experience. When the Highest One manifested Himself as so many forms, equality of rights for each of these forms may be presumed to have been in the ground-plan of His work. Even under the conception of an extra-cosmic personal being as the creator or evolver of the universe, there is no variant for a contrary presumption. The scriptures of all faiths reflect this sentiment, and all social dispositions must be dominated by its influence. That of the human organism being the most perfect known to us, the arrangement of the entities in the universe cannot be designed, as far as one could conceive, on any better model. However, straggling bits of evidence from the records and remnants of the beliefs and practices of the past have been viewed from diverse stand-points and pieced together in diverse ways, but it cannot be said that any one position yet taken up fulfils the conditions of historic certitude or scientific accuracy.

169 Civilization has everywhere a heterogeneous garb in the form of division of labour. This division is nowhere an imposition by external authority. It must rest, as long as it lasts, on a basis of rights* *conceded* and duties *undertaken* by mutual consent. This consent may be formal or implied, and the basis may have been built up either as the result of a long process of competition and natural selection or as a purposive act of *a priori* arrangement. However, the names given to the classes engaged in such labour and the nature of the distinctions among them do vary in varying countries. In India, analogy with nature appears to have been the guiding principle. When it was divided into a number of political divisions or *Rāshtras* (56 is the number usually given), each was a complete organismal constitution, with its industrial, exchanging, protecting and religious organs or classes, speaking a common language and owing allegiance to a common king, all under a king of kings or emperor for the whole Peninsula†. India was thus a nation of nations. Caste distinctiveness then could no more stand in the way of communal feeling within each nation than the distinctiveness and dissimilarity between the hand and the heart detract from the fact of their forming, with the other organs, one single

* Here, right means a guarantee against encroachment on the labour as owed, and duty, an obligation to do it.

† *Ekachhatradhipati*, as he was called. Unlike every other labour in India, this position was not placed above competition. The incumbent had his own separate State and held, as long as he could, imperial sway over every other, accepting a tribute as a mark of suzerainty, and leaving each State to itself in other respects.

organism. Each of these four main classes was split up into many to discharge the various functions created under the principle of division of labour and to each of them was given a special name. The industrial classes and their sub-divisions are the producers. They constitute the pillar that supports the entire burden of the society's life as the existence of a thing is the foremost, and as religion, protection and commerce come only next in importance. It is from them ultimately that the other three main classes who are by contradistinction, termed the consuming classes in a society should receive their remuneration in the shape of benefices, revenue and profits respectively for their religious, protecting and exchanging services. Each caste or class and each sub-division in it remained distinct from every other. Interdining intermarriage etc. were openly prohibited and customs and manners were peculiar to each. These distinctions which in the totality constitute the structure of each social organ were as in the human body intended to preserve the cleavage of labour by creating a community of taste as between the members of the same division and as against the members of another. In the West too, there is found this cleavage into labour divisions. But their names are not specific caste denotations, but are made up by the prefixing of an adjective indicating the actual occupation to the common name or class such as metal working and pot making classes which in India, would be known as Kamudians and Kulians. But the number of such class divisions is necessarily many more than in India, on account of the much greater demand for her labour in the world's markets. And running parallel with it are the social distinctions. As in India, they too relate to personal items, such as, interdining, intermarriage etc., but the prescriptions and prohibitions involved are not open and formal. And as these distinctions are based on wealth and run crosswise through instead of being determined by identity of occupation an artificial sympathy of status is created, which works against the natural sympathy of labour sets one section against another and must, in the long run lead to the inefficiency and instability of the society itself. Though function is getting mostly hereditary it was much more so in its days of hand labour but the distinctiveness of structure has never been stereotyped into caste law which in fact, even in India, was really the record of accepted opinion and practice. For if it had been the community of social life which the sameness of structure would have ensured would have prevented the separation into masters and men the first result of modern industrialism from so readily leading to the wounding of mutual sympathy between the capitalist classes and the masses engaged in working under them. In India now with the fast lessening of the demand for its productive labour even at home stability of labour is gone. What is spoken of as its increasing mobility must in a once settled society mean its increasing instability. Labour cleavage is gone therefore. There is a scramble for such labour as can be got and awayed by the example of the West men of equal status form classes and the class sympathy thus set up must operate to destroy what little organized labour remains. As thus the fulness of functioning and the interdependence of one function on another which together constitute life are on the decline, India now shows a mere mechanical grouping of part and presents a hierarchical arrangement giving rise to the theory that caste was *organised cunah r rchalla*—an evolved mixing up of analogues.

10. Nature is the great standard of all human dispositions. Then the greatest principle of differentiation of name and function is found. The great all-revealing luminous orb has a special name form and function in the economy of nature. So has a tree created her leaf. So too was attempted to be a rounded likeness in India. Under a division of

labour and with distinctiveness of name, mutual encroachment among the various sections of labour may still be expected through the force of individualism or misused freedom. This was sought to be prevented by providing equality of remuneration for all and by making it unnecessary for any to covet a change of place. Ordinarily, every person will be content with the function of his caste if, with no adverse competitive conditions, he is enabled to live free from want and from the fear of want for himself and for his progeny *. The distribution of the country's production in shares of one-sixth (*shad̐bhāgam*), not only for the protecting, but also for the agricultural, industrial, distributing and religious organs, the remaining one-sixth being reserved for the succeeding year's production, ensured, under an automatic regulation of numbers by the demand and under a permanent settlement of value equivalents for the various labours, equality of income in the form respectively of revenue, prices, profits and benefices (temple endowments, charities and donations). Within the same productive labour, the absence of machinery rendered any unequal distribution impossible. But still, there was the fear of mutual encroachment asserting itself as the effect of inequality due to any extraordinary cause. Here was the use of structure. In nature, every object has a form or structure which enables it in doing the function attached to the name, and disables it from doing any other function, nature being thus a wholesome amalgam of name, form and function. To name and function, therefore, whose invaluable uses in society for discrimination and easy efficiency have been already referred to, distinctiveness of form or structure with the mutual exclusion usually associated with it, was added. In other words, to guide sympathy along the lines of labour and to prevent encroachment on one labour by another, sharp structure-distinctions came to be established in customs, manners, habits, dress and ornaments, language, ceremonies, festivals, etc., as well as exclusiveness in inter-dining and inter-marriage, and separateness even in the matter of residential quarters.

Structure serves another purpose. But for it, every object in nature would need a sign-board or label, to denote whether it belongs to the animate or the inanimate kingdom, and to show what its order, its genus, its species and its function are in the organism of the cosmos. It would also mean that everything has the power to, and may, do all the functions. In the absence of such a discriminating guide, there may be either overflow of functions or total want. This would be absurd. It is exactly so in society, where if structure be not given to sexes in a family, or to classes in a nation, or to nations among mankind, no one would have any responsibility to do anything. There will be nothing like duty in the sense of organic function, and the primordial chaos with which, according to the *a posteriori* observer, the universe started, will remain unchanged for ever. When the alarming effects of conflict in labour-interests, both national and international, now so much in evidence, is remembered, we cannot, it will be conceded, have too much of this self-acting arrangement for placing mutual encroachment wholly out of court.

171 To take a familiar analogy, the structure of a caste is the uniform fitted to it, which all in it was to wear, from the highest to the lowest. A Government provides uniform to its departments, Police, Salt, Abkari, &c., and insists on their wearing it and on unceasingly performing the function associated with the respective uniform. It also insists on that function being performed by no

The principle of caste structure, further explained and illustrated.

* According to the authority of Herodotus, the priestly office has remained in the same family in Egypt for thirty generations.

other. This is rigidity in administration. Why is it enforced? Why is it asked, is it not relaxed, especially when the relaxation could be justified on the principle that the law of competition and free selection is the mainspring of universal evolution? When an agriculturist can freely give up his land, and betake himself to the profession of a goldsmith, it means he can renounce his accepted duty to raise produce from land for the use of society and undo the concession he in common with the rest of society made to the goldsmith that the latter may do his (goldsmith's) work without encroachment or fear of encroachment. And if such a procedure can be justified, on the ground that the agriculturist in question can do the goldsmith's work better and cheaper than the goldsmith himself, why should not if a person feels he can dispense cheaper and better justice than an appointed Justice of the Peace, the people be allowed to obtain that cheaper and better justice at his hands? Why should Government reserve the power of making appointments in its hands and interfere with the law of survival of the fittest in doing its wholesome function? If that is allowed, can order and discrimination be kept up in the function of administration? As the social arrangement of caste is by families and as the official agency of modern governments is by individuals, the analogy may seem not quite exact. But the essential principle is the same, namely whether an appointment made by government or society and accepted by all whom it may concern be fit individual or family could be changed except with the sanction of the responsible appointer without causing disorder and insecurity. If therefore one organ of the social body whose working is under the direct control of Government, should not be placed in the competitive market even on the ground of placing it in a scientific environment that would be conducive to efficiency, no more. It is claimed by the advocates of social organicism could the other organs, hardly less important, be so placed. The duty of Government does not stop with the maintenance of the administrative organ. Competition and free selection have of course their part to play for instance among the children who are trained in a school for a special trade in life. They are needed to enable one to see whether they are fit to take up the duties and responsibilities of the trade, when they launch out into the life of a householder. In the same way competition and free selection have their place in the unsettled, child-state of social life. But as soon as society gets settled down, continuity of function and heredity must step in. Else that society will be still in the training college of mother Nature and cannot deserve to be called "settled" society. Further protection against direct encroachment on person, or on property which is the product of labour does not exhaust the function of protection. It is but a protection which an ordinary individual even in an unorganized society can give himself by physical force. It is the guarding of the source of property i. e., labour against indirect encroachments, often subtle and unrecognizable to the uninspecting and untrained that constitute the first and the most vital function of the body politic viz., the king and his officers. In this view it would seem permissible for a Government responsible for preventing conflicts between established departments of labour in a society to recognize the sole right of an organ or caste to work in its traditional occupation. Such a recognition is not in essential principle different from the institution of monopoly which a Government reserves to itself in the matter of certain productive labours, such as, salt, ganja, etc. as part of its revenue policy or from concession which it grants to capitalists working at minerals in view to the encouragement of new industries. To secure the same object through a less artificial and a more self-acting process, differentiation through structure was required to have its justification in society.

172 The family or home is the root of the national tree, and if the compact between man and woman be not firm by unalterable nature, the root of the nation must be in danger. A nation consists, not of individuals, but of families. Even the savage leads a family life. A state when man and woman lived in no pre-established compact cannot be ordinarily conceived. Supposing that they did live so, an accidental meeting would develop into joint-living. Even then, all the limited functions of the savage life, viz, the out-door work of gathering food and the in-door work of preparing it, may be done for a while by both indiscriminately. But experience must, in course, teach them to divide these two sets of work, the female selecting the in-door and the male the out-door. This step of advance must make them feel more comfortable than before. When they become members of a society or nation, the out-door work of man changes from a state of self-dependence for all wants and hence of having to do all functions, to that of dependence on others for all except what he undertakes as his share. But the in-door work of the female remains unaffected. It is called family duty. By doing any of these functions, in-door or out-door, both so vital, one cannot be said to be inferior or superior to the other, nor can the one be a "down-trodden" and the other an "up-trodden" sex. On the other hand, both male and female trying to do the same function must mean a reversion to the savage state. It would be to establish parallel lines of individualism in place of the converging lines of mutual service, and if the law of the separateness of function for the sexes is gone against, nature will in the end assert itself under heavy pains, and drive the male to social work and the female to family duty.

The present-day man wants to make his companion like himself in every respect. She is beginning to be drawn out of her natural place, into the field of labour-war with man. The idea is to give her greater freedom and equality. But it is over-looked that the law of inequality has its utility in the economy of life, and that nature knows no absolute freedom. Man is a slave of mental and physical laws, and interdependence is the real and the highest freedom which a human being, or in fact an entity, can have. He sees woman's dependence on him, but not his on her. He believes that to discharge family functions only is a down-trodden condition. But he does not recognise that to throw all the labours into competition between man and woman is nothing less than to destroy the family compact, and would only add, as if that was not sufficient, to the competition between class and class and, nation and nation, in the sense of "you live or I live", instead of "we live and help each other to live", which is bombarding the national and international compacts in the world. In fact, to "unsex" woman is, like the process of "uncaste-ing", only to make the human race ineffective for the present and irresponsible for the future.

Here, neither the woman nor her friends are to blame. Woman is entitled to live, and to live in ease and dignity, no less than man, and if she should be content with her structure and function, every disability in her way must be removed. This is true as much of the female sex as of the "depressed" castes. The disability does not of course consist in the obligation to exercise a certain right of function, essential for the perpetuation of the race on the one hand and for its continued well-being on the other. It is the difficulty sorely felt, under the present economic forces of the world, in exercising that right without want or discomfort. And in the consequent struggle to live irrespective of one's appointed place in the scheme of civil society, woman is at a special disadvantage. Her established natural structure which, for the reason that the arrangements for *existence*

have to be more unshakable than the equipment for happy existence has become part of her inseparable constitution handicaps her as is the object of its establishment, much more than the artificial restriction of caste customs does to her similarly placed brethren, the "depressed" classes. Throwing off the structure of caste is much more easy than the throwing off of the feminineness of woman. But the emancipation of the female sex is not the divesting of her function nor the gradual obliteration of her natural structure but only the freeing her from the difficulty in *functioning in accordance with that structure*. In this sense the woman question is in principle quite the same as that of caste. And just as the regulation of the economic forces, whereby every worker using that term in its widest sense, could find his wages and the condition of his labour improved so as to assure him of fair ease and comfort is the solution of the great problem in social polity, the same regulation would soothe the woman question whereby every man would be able to look on the married state as the normal condition of adult life and treat woman as his respected and cherished counterpart in the paramount function of family life and race perpetuation for which he and she are so pre-eminently fitted both by structure and by heredity. Says Sister Nivedita whatever new developments may now lie before the womanhood of the East, it is ours to hope that they will constitute only a pouring of the molten metal of her old faithfulness and consecration into the new moulds of a wider knowledge and extended social formation."

173. The structure whether of a caste or any of its sub-divisions is made up

The present-day
features of caste,

of the same constituent elements as that of any other. But in the varied combination of them lies the difference. That this differentiation has occluded the underlying unity will

not to the student of nature be strange. He often despairs of finding nature's unity and her eternal laws in the midst of the heterogeneity and complexity in her fauna and flora. But the social fabric of India being greatly disarranged now makes the recognition of unity even by the Indian, especially difficult. Some of the ancient territorial divisions, such as the Konkan and the Sourashtra, have disappeared as separate organisms. Each of the remaining divisions has not only cut off its relation of mutual dependence with others, but has been encroaching on them. Many of the organs, such as the miners of various metals and precious stones, spinners of cotton, silk and woollen threads, salt and indigo producing castes, have disappeared and under the misuse of the laws of equality and free selection every organ has been tearing off its vital structure and is encroaching on others' land and labour. In fact, each has almost reduced itself to a structureless, nameless, functionless, placeless mass of human beings, in the obviously unscientific belief that the conversion of heterogeneity to homogeneity is progress. For example some people of the Tamil tract having given up their land and labour at home live in every other while some of every other live in the Tamil tract. As for the main castes and sub-castes, much need not be said even to the most ordinary observer. He can see the Brahman working in all the functions, having given up his religious labour and living in or near the quarters of other castes whose functions he has adopted. This sort of migration of the people of one tract of Indian territory to another and of the members of a caste belonging to a certain residential locality to another function and to another locality never happens when they can manage to live on the same function and in the same locality as originally fixed. Even, should it happen, it could do no harm, provided the mutual relation of tracts and castes is kept alive and maintained. Again as

§ 7. Try to see, speaking from the standpoint of women —

—O counterpart
Of me art thou, well are we made and born,
So built, so great, so noble are you formed.

those that so migrate and encroach retain parts of their original uniform or personality, they have no sympathy with the people or castes on whose land and functions they encroach, nor have they any sympathy with the people of the same uniform, because they have given up the function attached to that uniform. The structure of caste is thus in varying degrees of disruption, and its existence here, coupled with its absence among the progressive societies of the West, have led many to trace to the system of caste all the misery and retrogression of the Indian people. But with its abundant and diversified labour, the West is forming itself into an organism. Not recognizing that her progress is towards organism-formation and that the present trials and troubles would disappear when that process is complete, and not recognizing, again, that the East is on the reverse journey from organismalness to disorganismalness and that its increasing troubles are due to it, the Indian regards, as if by an irony of logic, the incompleteness in the disorganismalization as the cause of his insufficient progress or active retrogression. In the early completion of this process, the salvation of India is therefore foreseen. However, even from the existing relics, a person who will look deep can understand what the Indian organism once was, with its industrial, commercial, protective and religious organs, and then various divisions and subdivisions.

While referring to present-day features, a few words may be said about the great confusion and wrong activity in the world due to mistake in nomenclature. The same name, caste, can on no account be applied to indicate two distinct phenomena, namely, caste as it is and caste as it ought to be, and all the denunciation of caste based on the former should have no application to the caste institution. Again, "rigidity" is not an unmitigated vice. The bony frame-work that supports the human body has its highest virtue in rigidity. Without rigidity in the sense of conformity to principle, every principle would be a dead letter. The practice, stated and accepted by common consent, of one family undertaking *to do* a particular function and *not to do* another in view to harmony and efficiency, cannot be condemned as rigidity. On the other hand, the reverse must point to an unhealthy state of affairs, when one family finds it necessary to start a career of struggle for self-existence, to neglect its duty and to encroach in that struggle on the function of others. Under such a necessity, the rigidity of caste becomes a vice. But if the struggle for others' existence or the life of organismalness is the approved struggle, and is maintained as the guiding principle, the rigidity that prevents an inverse policy is *law*, which no loyal subject of the body-politic would complain against. In fact, the harsh ideas associated with "rigidity" and "enforcement" only come in when, along with the forgetting of the principle underlying the law, the conditions that led to its neglect are not removed, but the observance alone is insisted on. A weaver finds that his profession gives him neither adequate remuneration nor honour in society. He does not see the way of getting them as a spontaneous act of the society itself. He then ceases to believe in struggling or working for others and in leaving them to work for his interests from a sense of their own duty. He feels that he must struggle for his own interests and sets about doing so. His society sees only the weaver's neglect of duty and encroachment on others' duties, but not their own neglect to keep him in an adequate state of remuneration and honour. They say to him—"you are a weaver, you must weave. You must live in the weavers' street. You must inter-dine and intermarry only with them. You must observe their customs and manners. You shall not do anything else." This certainly is not an endurable position, and

under these circumstances it is, that caste rigidity becomes tyranny that a right conceded becomes an unmerited privilege that a duty undertaken becomes a burden imposed that in fact the whole system becomes a system of inequalities of rights and water-tight compartments with the doubtful redeeming merit of hereditary specialization—which, it may be noted are the three elements of the caste institution described by Monsieur Bongle

144 It is unnecessary to discuss the question whether the system which
Caste differentiation and social integration. cements families into a caste, castes into a nation and nations into the entire body of mankind, was the blind assertion of the laws of nature on the people of India, or whether in the full knowledge of the utility of those laws, it was established as a deliberate purposeful act. That differentiation through structure is in the nature of things, and serves the important function of integration, is evident. Matter exists. It is either a conscious entity manifesting itself in or evolving itself into the world, or it is an inert substance shaped into many things and enlivened with diverse activities by a conscious moulder. But in either case the law of differentiation is a requisite factor. Mere separation or distribution of matter in space will only create a comedy or tragedy of errors, and cannot lead to discriminate activity. Further the imprinting of structure would alone enable the force of heredity to carry on that structure to the progeny. Its operation within the womb is usually so strong as to neutralize any force of environment that may pull in an adverse direction after birth. But if this environmental force be in harmony with the force of heredity, which continuity of occupation and the maintenance of external structure from generation to generation must render possible the result will be an intensity of effect. It may be said that the theory of transmitting acquired characters from parent to off spring does not stand on an undisputed ground work. But for the acquired to partake of the features of the natural it is only a question of time. In any case the average son of a carpenter is not less fit for carpentry than the average son of a priest, and the facilities of environment, instruction, apprenticeship, continuity of occupation and the maintenance of a proper adjustment of supply to demand are circumstances in favour of continuity of family function as the guiding principle of social arrangements.

If hence therefore is not to be of academic interest merely but to receive its highest fulfilment in its application to civil life there can be no hesitation in accepting the organismal principle as alone making for social integration and for that all social propriety and abiding brotherhood which can come only from social integration. It is no use attempting to break the plea for an integrating ideal by challenging the pleader to explain the ways and means to the satisfaction of the pleader. If one cannot improve a situation he has no right to aggravate it. If an ideal is indispensable. If the one suggested is the correct ideal and if no other ideal satisfies the requirements of *prima facie* logical acceptability it becomes the duty of all pleader and those pleaded with to jointly and responsibly think out the way with mutual forbearance and with hope. How the ideal shall be worked up and whether it could be worked up at all under the conditions obtaining at a particular time and place is another question and cannot affect the soundness of the ideal. If the state is healthy the nature of the disease produces conditions and the medium in which they operate are all such that the lines of treatment will not naturally unfold themselves. An impatient call for the prescription when the patient does not realize his illness, much less recognizes the way he is ill and the time will he should get to can only serve to feed a

hope that the treatment proposed, if proposed at all, may prove at first blush impracticable or absurd. But this satisfaction will not annul a disease if existent. Again, an activity towards an ideal is often pointed to as the *terminus ad quem* of progress, instead of a distinct statement of the ends themselves towards which the progress is to be directed, and progress itself is definable, not in terms of direction in time, *backwards or forwards, but in terms of approximation towards the approved ideal*. That the human frame may get into disorder does not argue imperfection in the *plan* of its build. That the disease may recur, the efforts taken to once cure it notwithstanding, is not in practice a reason for not attempting a cure even in the first instance. What *has* to be recognized is that a society without the view of an ideal is like a ship moving without a goal and a compass, and that if nature's ideal expressed in the word "organism" is *not* the correct one, what *is* correct has to be discovered and placed prominently before men's minds for single-hearted realization. Else, society will be like a car wheel, with each man or each set of men pulling in a different direction from the rest, can make no progress, or worse still, may topple over and wreck the workers.

The leader-writer of a well-known Anglo-Indian daily, * after describing the state of society in the West and after alluding in a preferential vein to the old feudal system, says that, instead of "the constant service of the ancient world", the server is "now hired for the occasion and discharged when his task is done" * * * "But will this change be for the better?" He asks, and answers—

"Judging by western experience, we are not sure that it will. Amid the disintegration of modern Europe, only one class has retained its traditions in any marked degree, and that is the landed class. The value of these traditions is universal, but they have only been preserved by tying up landed property in families, and thus preserving the hereditary principle. The mass of the people have lost their traditions with their cohesion. When we contrast this interdependence of classes with the individualism of modern times, we see that much has been lost, even if something has been gained. The losses are shared by all classes, by the noble and wealthy as well as by the commoner. High rank and vast riches may leave their holders isolated and a prey to *ennui*. But those who have suffered most are the lower, middle and working classes. The latter have no permanent place in the social fabric. The serf of the middle ages had at least to be kept alive in bad times by his owner, but the worker of to-day has no recognized moral right to a livelihood, though he is at liberty to exact all that he can from his employer. The old forces which bound them together have been weakened until they are almost extinct. Kinship is now a very narrow circle. The ties created by feudalism could not be re-made. The problem before modern statecraft is to find a new bond which will reintegrate society and make humanity an organism once more instead of a congeries of disconnected atoms." Patriotism is the only tie that now knits a nation together. But "society used to be knit together", says the writer, "by a stronger tie than patriotism. Patriotism itself is now national or pan-ethnic. A man is a Britisher or a German and particularism is decaying, though it survives in a few backward parts of the fatherland and Ireland. And the Britisher is thinking imperially, the German and the Slav of Pan-Germanism and Pan-Slavism."

But what is the nature of the patriotic tie? It is not generically different from the combining that takes place among savage families under the fear of being deprived by others of what they may have secured, or for the sake of securing what others may possess. This must grow languid with the lessening of any of its motive forces. But if human units form themselves into a society or nation for the conscious purpose of service-exchange, the union must be an organic one, and there is no room for the misuse of the struggle for existence and for all the troubles traceable thereto. In the first stages, they may from habit misuse it, *i.e.*, struggle *against* others' life or welfare, instead of *for* it. But pain will soon

* The Pioneer of Allahabad, dated the 2nd June, 1912

bring them either to a sense of conscious duty or unconscious necessity. Civilization, therefore, which is a condition to which a nation is taken to ascend from savagery primitive or mediæval and where human beings satisfy their numerous and varied wants, not only without harming one another but with positive mutual helpfulness, is the attendant feature of the organismal state only which the writer just quoted points to as the goal. The tie of organ to organ in a social organism is obviously not the feudal relation of superiority and subordination. It is probably the tempting analogy of the latter-day hierarchical caste to the discredited feudalism, that brought the caste institution into obloquy. It is co-ordination or rather mutual sub-ordination that constitutes integration in the animal organism. Caste is only the application of this principle in society and integration the want of which in modern society all the deeper thinkers of the day greatly lament, cannot be sought in any other direction, *unless* the example of nature and the precept of science pay false. Applied as a universal system it frees families, classes and nations from the fear of property, labour, land and life being encroached upon; it saves mankind the time and energy now spent in defining the functions and relations of its members at home and in developing the machinery of warfare abroad by making life's course certain and uneventful, it renders it needless for a family, class or nation to write its history and lastly by making man extend his mercy to all his fellows, it encourages him to see how he can extend it to every other thing in the universe and achieve the highest goal of religion.

115. In the light of the observations made above, it may not be unprofitable to see how these principles apply with reference to the activities of the day. The ideal of India is the organism. Everything is a unit of an organ and every unit works automatically and sometimes even involuntarily like the cells and organs in the human body. As each organ has a function to do with reference to every other it commands equal respect with it. In fact, like the law of gravitation or mutual attraction which helps to keep up the cosmos of nature, the linking of functions serves to maintain social cosmos, and every part is happy and prosperous in the midst of apparent subordination and self-sacrifice. If from the economic disruption of society the arrangement be reversed and organ and function get divorced from each other, mutual attraction gives place to mutual repulsion, every unit sets up to serve itself without reference to other units, and clash of interests is inevitable. In the midst of apparent self-interest, every unit is unhappy and is either unprosperous or insecure in prosperity. The force of individualism then asserts itself and the rights and disabilities of organical structure relating to occupational selection, intermarriage, dress, customs and manners, etc. interpose as is the purpose of their establishment, as so many hindrances in the way. The break up of this protective structure becomes the first necessity in this individualistic activity. And it is hoped that when this process which has been in slow operation for nearly thirty centuries now is completed the era of liberty in all the transactions of life will dawn in India. But the throwing off of the old institutions has to be accomplished against the weighing-down force of long custom. Their foundations seem to be so broad and deep that the last stone has not been yet disinterred and cast out. Those members of the community who have a clearer and a keener perception than others of the desirableness of these institutions to disappear without further delay go under the name of "social reformers." These latter clearly see how these institutions handicap the individual in his struggle to live and feel the need for their early demolition. There are others who recognize the ideal which these insti-

tutions represent and the error of encouraging the individual unit as against the social organism to which he belongs. They therefore struggle to retain them, but without realizing and trying to secure the conditions under which alone can the ideal be reached or kept up. There is a third class who, realizing the soundness of the ideal on the one hand and the incommodiousness of the working conditions on the other, merely call out, "hasten slowly." They do not generally stop to see whether the effacement of caste structure is good or evil. If evil, there is no need for compromise or delay. But if otherwise, the direction of activity should be a different one altogether. The scientific solution of the whole problem, therefore, must lie in an examination of the principles underlying the institutions proposed to be modified, in the examination of the conditions in the light of these principles and in the manœuvring towards an approved ideal by making the conditions favourable for its attainment. If that is done, all the problems that are on the tapis of the social reformer — who, unlike in the West, is not a reformer of material or political condition, which alone is social there, but of personal and domestic customs, such as, widow-marriage, post-puberty marriage, sea-voyage etc., — would admit of a settlement, more unanimous and hence more permanent, than now appears possible. It would then be plain that, what India suffers from is economic struggle, which is making the most salutary arrangement seem the most pernicious, and that the first thing that India wants, not Hindu India merely, is the re-plenishing and the re-organization of labour. The greatest publicists, even in the West, — the industrial bee-hive of the world — do not aim at empty shibboleths when they place before themselves, as their highest ambition, the *assuredness of employment* and *adequacy of wages*. The depressed or so-called lower classes, for instance, who constitute the agricultural mainstay of the country, form a most fruitful topic of present-day discussion and deserve the most urgent attention. But to raise their condition, it is the wages of their labour that, as the first step, has to be generously seen to, so that they may feel sufficient self-respect in common with the others and the dignity of their vital place in the body-politic may be vindicated. That not being done, the natural tendency must assert itself, as it is doing, to seek other occupations more paid and better honoured, no matter what its effect may be on the labour given up and on the social organism in consequence. To obviate this tendency, the cause must be removed. If, on the other hand they be only equipped for, and encouraged to join, the struggle to live as unproductive labourers under government, mercantile or ecclesiastical bodies, which alone are now well-paid and honoured, it cannot be considered a scientific or effective policy. If, therefore, a social goal in its direct perspective is held up for realization, the changes now under consideration will sort themselves into necessary and unnecessary, and action will be smooth and decisive. All this is no conservatism in the sense of 'trying to keep things as they are'. If to stampede towards an ideal indefinable except by the name, progress, given to its pursuit, and inaccessible except through the individualistic law of struggle for existence, is "to be liberal, to march towards a goal which, whether reached or even aimed at by the Indian ancients or not, has its sanction in nature, cannot be, to 'stagnate'." Of course, every social move must be as one unit. He that would introduce any reform must take the society with him with their full and intelligent consent. It is no use to appropriate an assurance to oneself that a few have only to move on and that the rest would follow. If they should do so and leave the rest to lag behind overtly or in spirit, it is nothing less than breaking up the unity of social compact and committing what may be fitly called a social sin.

176 As a natural supplement to the paragraphs dealing with the structure of

**Structure and
personality**

the caste organism, a brief reference may be made to the general structure of the organism as a whole. People of many a civilized nation live side by side with the Indian in India.

Each has cast his habits, dress, rituals, festivals, ceremonies, language, religion, games, gestures, tone etc. quite different from every other. By observing them, one can say to which nation an individual belongs. Just as in all the one thousand and odd millions of the earth's inhabitants, every human being is distinguishable from every other by matter of his form, every nation has a form of its own, which nature has given as a kind of label or sign-board with the distinct purpose presumably of discriminate activity among mankind. This is its personality and is regarded as natural or artificial, ordering as unconscious or conscious exertion has led to its formation. Man dies if his form is destroyed. So also must a nation, with the destruction of its personality or form. The immortality of the soul does not count for the purpose of bodily existence. No nation, however weak, therefore gives up its form or personality and takes up that of another as it knows that a nation attempting to transform itself into the externals of another must disappear among the latter. On the other hand it struggles to retain it at any cost. Several nations come in a direct and others in an indirect manner are connected with each other and with India, through industry, commerce, politics and religion. They are propelled to be so connected by the force of unity underlying the diversely manifested unity. Their connection with India means India's connection with them. And this is a divine dispensation, the aim and purpose of nations in bringing themselves together being to establish an external tie through mutually helping, but not harmful, activity designed and carried out in concert with their internal unity. But there is a point in the manner of its use. If in the connection, a nation retains its own form, then it will live as a nation. It is obvious that, without form nothing can exist and it is the customs, habits, etc. infused by the complicity of a host of physical and mental laws for ages, that go to give as already stated, a particular structure or form for the whole social organism or nation, and a special structure to each of its classes. As the supply of articles and services by the various labour functions is first established, the structure either from conscious or unconscious necessity, in those labours or functions must depend the maintenance of that tradition. But as time goes on, the continuance of the structure so established, to the very existence of the labours or functions, naturally becomes dependent. Structure and function in the national body thus act and react on each other quite as much as in the body physical.

177 Destruction of nation, habit, dress, language etc. therefore is the de-

**The soul seeks
in India,**

struction of national personality and no one belonging to any of the connected nations of India ventures to change the form

or uniform given to his nation except for a special or national purpose. It is in fact a part and parcel of the nation's own form or personality. This tenacity of form has existed in India throughout all the early period of its history. The hold which it has on the Hindu mind is very perceptible most clearly seen in the history of the Christian mission and in early recent times. The Jesuits Xavier and Fr. de Nobili dared not turn the Brahman in order to convert the south of India—they put on the dress, shaved the hair, they made frequent abstinence, they lived on vegetables, and mark the yajñ on their foreheads the candle put to use by the Brahman—indeed, a VV pulled a bull sanctioning this regulation in the Christian Church in India. But owing to the social class

Structure and Personality 176

and general depression consequent on the wars with other nations for several centuries, the Indian has lost belief in the value of the customs, habits, etc., which constitute his national personality. Millions have become converts to different religions some partly retain the old creeds and partly accept other creeds, many have no religion at all some are quite content with the change of dress. Some neglect national festivals some periodical ceremonies, some daily rituals, some give up temple-going some omit the putting on of marks on the forehead, *et cetera, et cetera*. In this way the Indians have torn themselves into diverse groups. If each detailed item of a nation's personality is to be taken up and the direct and indirect effects of its neglect traced, the treatment of the subject would swell unduly. It is sufficient for the purpose merely to note that the neglect of a custom, habit etc. must affect the fabric of those that ministered to its up-keep and be reflected in its prejudicial effects on all parts of the nation's life and when it is said that the ancient Egyptian, the Assyrian, the Babylonian and the Roman have disappeared, it does not mean that they have become extinct to the last family. It only means that the personality by which each was distinguished from other nations was broken up and effaced and that, in addition to being reduced in affluence and numbers, it was absorbed in the personality of another and began to be known and recognized as part of that nation. The Indian is tearing off his personality bit by bit without let or hindrance, in the manner and to an extent that no modern nation would think of. A European keeping a tuft, or taking to the loose garment of the Indian, admitted even by several Westerners to be so fitted for the tropical heat or chewing pin or tobacco, or doing one of the many other things included under the head of Indian national personality, may, it is more than probable, be treated as a lunatic. It will be so obnoxious to the canons of his society, in other words distinctive of his national form. But a similar change by the Indian in favour of the European personality will perhaps only confer, as matters now stand, a title to be regarded as an up-to-date person, and even go to enhance his market-value. He may however repudiate, and do so quite honestly, all charges of denationalization. But he has only to ask himself in what sense he is still national. There may be his Indian nativity which is unalterable. But this, he has in common with members of many other nationalities settled in India. There is also the Indian parentage. But from that parentage he has inherited only the natural personality of physique, such as, colour, etc. Nationalism has then no meaning except as a political idea of common Government. But Indians are not the only people under that Government, and cannot, having personality, natural or artificial, have any special collective existence. And if this is the consummation in view, there is nothing more to be said. Else, he may be reminded of the Scotch byeword, "in my a muckle makes a muckle." In the economics of higher life, cause and effect do not follow one another with the abruptness of a bomb explosion, though not with that finality either.

This self-disintegration and destruction of national personality, it may be noted, has been going on for several centuries. The process, having been slow and gradual, and the personality being vast and extensive in space and in time, the effects were not felt in the first stage. But the nearer to the goal, the greater the velocity. The most unfortunate thing is that, as the change of personality is a voluntary act undertaken in the full belief in its beneficialness, untoward happenings are traced, not to it, but to that portion of the personality that still stands unshattered and intact, and towards which, therefore, the further activity of substitution is directed. Different civilized nations have different customs, manners, dress, language, etc., and so cut different figures or forms. But the form has nothing

neglect of its national religion and the Government, of its protective function. With a social organism so arranged with structure and function, it would be easy to know what is the demand and supply of each article produced by an organ or class in a country, what is its value compared with that of every other article, how many people are working in it, how much income it can fetch annually, how much revenue it can pay without inconveniencing its existing constitution and its capacity for reproduction, whether the classes are progressing or deteriorating, as may be judged from the quantity and quality of the article each produces, how much coined money is required to be minted for the exchange purposes of the country, how it can be circulated in due measure to the whole organism, how discriminateness may be exercised in the levy of taxation, especially when the needs of an organism require more than is proportionately leviable on the basis of national production, etc. Without these data, the activity of a nation must be indiscriminate. An organism that does not see the necessity of keeping account of its production and distribution cannot see its way to its own adequate protection. It is a mistake to fear that in a nation so distinctly divided into different classes, each class would feel a sense of separateness. It is only when there is no function-exchange that the necessity for each other's existence is not realized. It is then that the idea of separateness is created. Otherwise, all would work for all and all would live for all.

Again, it is not enough if the people in a country establish themselves as an organism or nation with organs of different structures and functions. Organismal or national life should continue, though its generations die. The object with which a people form themselves into an organism is for higher pleasures and superior happiness. If they disorganize it again, the object with which they organized themselves fails. If they cannot develop the organism further, they must at least retain it at all costs, and keep up a continuous flow of life. The separateness or exclusiveness of caste divisions did not cause any chagrin in Hindu society, as it now would, as both the law givers and the law receivers, believed in the transmigration of souls and the re-birth of men into families and surroundings suited to their equipment and character both by ascent and descent. This faith is tenaciously held even now, and several genuine Hindus believe that the late Emperor, Edward the Peace-maker, was the incarnation of Dharmaputra or, as he was called from his proverbial pacificity, Ajātasatru (he to whom no enemy was born), and that the Emperor George V, whose coronation at Delhi happened to be on the Phalguni star (the asterism of Arjuna's birth) is the incarnation of Arjuna himself. The law of heredity, therefore, being a positive law, the negative force of free selection should assist and be subordinate to it. With the help of discriminate free selection, man should make progress towards the organismal state, *until* all the organs have been balanced by the laws of supply and demand, internal and external. Afterwards, he must exclusively apply the law of heredity for the continuance of organismal life. Free selection *after* organization is unscientific. Further, the internal encroachment on one another's labour or function, which free selection means, will give room for external encroachment, and disorganize the organism more and more by action and reaction. Progress, they say, comes through competition or struggle against each other. If competition is a universal law, a nation, a class or a family may apply it among its own members. The result would be speedy extinction. It is co-operation among the organs of the body that makes a healthy and happy physical life possible. It is no less true in regard to families in a class, or nations among mankind. The success of modern people is wholly due to the assertion of the co-operative principle among themselves. No doubt, there may be some small

as the case may be, and that no time, energy or money should be wasted in blaming deceiving, intimidating, or showing violence to, then brethren at home or outside. The second step is to recognize that, in the tempestuous ocean of external competitive forces, a vessel can only be repaired, but not be broken up and rebuilt. From various causes, many functions have died and many organs have disappeared. But none of them has been replaced on the model of the West. Though peace was long ago restored, the rush of men disemployed from the functions of the caste system is only towards service under government, mercantile and ecclesiastical bodies. All the misery due really to the disfigurement of the system has been attributed to the system itself. The attempt to remove a wrong cause can only aggravate the disease. Brahmins, Kshatriyas, Vaisyas and Sūdras are not apparently wanted. It is felt, however, that there must be people to work in religion, protection, commerce and industry, so that they may form themselves into a nation, set up equal rights with other nations, make political advancement with India as their country, and co-operate or compete with other nations as all civilized nations do. But discontented with the names and forms, it would seem, the people are destroying the functions themselves, i.e., the life of the organism. No doubt, names and forms have no meaning and smell un-sweet when there is no function attached or when the function has low wages and small honour, but it is forgotten that these missing ends cannot be secured by the abolition of the existing form and function. In regard to the names, it makes no difference what particular name is applied. Why call a useful dog by a bad name and hang it *for* that name? Indians, if they are wise, should not, therefore, further disturb the structure and functions of the caste system. Each caste continually discharging a particular function is like the elements in nature, air, fire, water, etc., each continually doing one function. Such a monotone, with knowledge and with a sense of duty and responsibility, maintains harmony and happiness, but, with ignorance and under the goad of necessity, it creates discord and misery. The imparting of this knowledge and the creation of this duty and responsibility should be the aim of the would-be restorer of the caste-ideal which, being nature's ideal suitable for all conditions, negative and positive, is the goal of every nation, whether consciously or un-consciously pursued. What should be done, therefore, is to repair and rehabilitate the edifice, now in various stages of disrepair. If any organ has only a form and a name but no function, a function should be given to it. If there is no name nor form to a number of people working in a labour, they must be given a name and a form. If an organ has a form, a name and a function, but is low in income, steps should be taken to raise it.

If thus the organismal state is established or rather re-established, and India enabled to help others while helping herself, other nations will feel drawn to follow in her footsteps and join hands with her in contributing, through the channels of separate national organization, to the organization of mankind in general. Of course, in the place of Bhārata Varsha, the old arena as a whole, the practical advocate of the caste ideal in this country will have to substitute the British Empire with the States allied by treaty relations, India, though an organism in itself for the purpose of its internal economy, being with reference to the great Imperial organism, only one of its several organs. When, by these means, what is, though in indifferent order, has been assured and strengthened, it will be safe and easy to construct the institutions of modern industrialism and enter the comity of nations in their world-wide industrial life. With such an ideal enabled to be steadfastly kept in view, all will live in harmony and work for each other's welfare. Then would the ideas of putting a stop to international wars, of introducing universal

money of universal brotherhood etc., fall under the domain of practical politics. International unity and universal brotherhood will never come about by merely saying—Go to now let us be united." The originator† of the International language "Esperanto" has formulated his principle that the feeling of separateness and even dislike of each other which men and nations may feel, will not wholly disappear from the face of the earth until humanity has but one language and religion. But actual observation does not show that peace and concord are the necessary accompaniments of oneness in faith or tongue.

180 Whatever may be the difference in the names of the systems, all the countries of the world must contain the four main functions of production distribution, protection and religion and the four main organs in some form or other. If one of the organs over-balances, or feels the necessity of over-balancing the other three in intellect and in wealth the society or state goes by the name of that organ or class, such as, industrial state, commercial state, political state church state. But when all balance one another in supply and demand : e by equal distribution of wealth as far as possible, it would be called the organismal, or in other words, the caste, system. Viewed in reference to this standard, a condition in which one class predominates must be lower on the scale of progress for unless the predominant class keeps strict watch and ward over the other three, they must all suffer and although this class representing as it would, one type of civilization, industrial theocratic, etc., may indulge in the assumption that so that type all civilizations must conform on pain of perishing it must for its own part suffer if it should forget the purpose of its predominance and thus fail to decentralize and balance itself with the others. It would then get thrown out of nature's machinery and be substituted by another organ or another type of civilization that may show a greater tendency to so decentralize and balance. The greater is such tendency in an organ or organism the closer is its resemblance to nature and the greater the resemblance, the longer is its life.

By way of illustrating how these deflections from the normal have brought the organismal ideal itself into disrepute, the following extract from a paper‡ read at the Universal Races Congress may be quoted.

"The purpose of this paper is really fulfilled in what has already been said. What remains is a short statement intended to serve by way of illustration, of the ideal principle as apprehended by the writer. This principle is that of the organization of humanity. It is sometimes hastily assumed that society is actually an organism. This is far from being the case. The word 'organism' in the above is used for lack of a better. In reality a new coinage is needed. Such words, a 'organism' and (organization) suggest the animal organism as a prototype to be copied, but wherever the notion of organism has been restricted to this prototype, the result has been ethically undesirable. For in the animal as in the plant, there is or some one pre-eminent organ or organs in which the significance of the whole is emphasized and to which the other organ and function are subordinated; hence when biological analogy is pressed when the animal organism is taken as the pattern on which the human world is to be fashioned, the resulting social system are of an aristocratic or monarchical character—

In regard to money it may be mentioned that money is a mere medium of exchange cannot suffer from it being a social fact. But it has vital function to serve in the social economy of a society to neutralize the pernicious effects of services monopolized by one or more nations or by one class or classes within the same nation. This function may be served, if money is distributed by depreciating the use of the current coin, and printing the postage paper—which is kind of universal receipt in the state treasury—with the lowest effect. There are other means, such as the levy of protective duties, heavy balance of labour can be maintained. In this is the question and the key. When, however, the system of internal and external competition is maintained, external competitive conditions are associated as between nations and nations and this, which is a natural competition would not serve—money becomes a mere medium of exchange. It may then be of the same character as the value of the whole world and the acceptance of money medium as the universal medium of exchange, the resulting social system are of an aristocratic or monarchical character. The purpose of this paper is really fulfilled in what has already been said.

† Dr. L. L. Zamenhof, Warsaw (Poland).

‡ Jy 1 Feb. 1911, Proceedings of Social Ethics and Internationality, New York.

some one function, like the military or the priestly, being assigned the rôle of expressing the life and purpose of the society as a whole, and all other social functions and those who perform them being treated as subservient. It is for this reason that the organic theory of the State has, in modern times, become suspect, as associated with reactionary tendencies.

The met-organic idea, on the other hand, is spiritual, and not animal, in derivation. Its distinguishing feature is that it excludes the notion of mental functions and functionaries. The distinction between high and low is empirical and based on the consideration of value. The spiritual view is based on the consideration of worth. And worth resides in every member of the social body, no matter how humble the station he occupies, in so far, namely, as he discharges his particular function with the whole in mind, that is to say, with a view of so fulfilling his function as to promote thereby the reciprocally stimulative interplay of the whole system of functions."

Comment is obviously needless. While the writer above quoted accepts the principle of the organisation of humanity, he curiously enough objects to the organism being made the type. But the difficulty will cease when it is remembered that the idea of predominance or pre-eminence of one organ over another, which is the vice he naturally wants to keep out, is not organismal at all. Each organ is pre-eminent only in its own function, and its authority is co-extensive with, and limited by, the necessity for the exercise of that function in the interests of the organism as a whole. For instance, the name, Raja, given to a king, is derived as *ranjayati* etc *rāja*, (he who harmonizes and makes happy, i. e., protects by preventing encroachment, internal or external, direct or indirect). His power or position extends no more.* So in regard to every other social organ, industrial, commercial or religious. In the human organism designed by a creator or evolved under law, no organ comes into existence without the organism needing it. To fall short of or go beyond that need in a spirit of short-sighted self-interest is not only not intended but is suicidal as above shown. Of course, meanings of words get distorted with corresponding processes in the thoughts of men, and if, in respect of the ideal indicated, the old words, organic and organism, are not sufficiently expressive and cannot be easily 'shroffed', though they may be "legal tender", the terms "met-organic" and 'met-organism', suggested by the writer above referred to, may be substituted. It is the phenomena brought under *their* definition which alone constitute the caste ideal. Neither the comparison between society and the organism nor the organismal ideal itself is therefore inapt or unscientific. It may, however, be said that the members of the former have a free will, while the parts of the latter have not, and that this difference renders the analogy false. But as indicated in the prefatory para, freedom of will is in truth conditional and hence practically in name only, especially in respect of activities regarding others, and conditional free-will is as good as no free-will for this enquiry. The final verdict seems to be that, to be happy and united, mankind should consciously and with nature as the teacher and exemplar, establish and maintain structures, functions and fixity of places for all its component parts and thus secure unity without uniformity, distinction without antagonism. Every thing, however small, is an organism in itself, and every organism, however large, is part of a wider one. The law of the universe is thus "infinite analysis infinitely synthesized". And on that law Nature knows no going back.

* For instance, *raja* dharma or kingly duty is more often referred to in Indian classic works than *rajadukaram* or kingly authority. The parental ideal of kingly obligation and the penalty of falling short of it are well brought out by Kalidasa and Valmiki in the following two memorable slokas of theirs.

Pragāṇām vinayādhanāt

Glossary of Castes, Tribes and Races

(THOSE INCLUDED IN PARTS A AND D OF TABLE XIII)

NOTE.—The figures entered within brackets show the strength of the caste as returned at the 1911 Census. Castes whose numerical strength is more than 2 per mille of the total population, are printed in clarendon type, as **Ampattan**.

Akur (12)—An Upper India caste of cow-herds

Akamutayan (15)—A cultivating caste found in the Tamil districts of the Madras Presidency

Alavan (870)—Also called Uppalavans because they work in *Alams* or salt-pans. They constitute the salt manufacturing caste

Ampalakkaran (51)—A Tamil caste of cultivators and village watchmen, found chiefly in the Trichinopoly district

Ampalanasi (1,996)—Literally one who lives in a temple, a generic name applied to castes whose usual occupation is temple service. The caste is also known as *Antaralas*, occupying an intermediate position between the Brahmans and the Sudras. The following castes are included in the generic name—(1) *Atikal*, (2) *Brâhman* or *Daivampâtî*, (3) *Chakkayâr*, (4) *Kurukkal*, (5) *Nampiasan*, (6) *Nampûti*, (7) *Nampayâr*, (8) *Nattupattan*, (9) *Pilippalli*, (10) *Pishâratî*, (11) *Potuvâl*, (12) *Pûppalh*, (13) *Pushpakân*, (14) *Tiyâttannu* and (15) *Vâriyar*. The four castes *Nampiasan*, *Pushpakân*, *Pûppalli* and *Brâhman* form a sub-group, known generally as *Unni* or *Pushpakân*, a name based like most caste names on community of traditional occupation, which is that of preparing garlands for the temples. The social and religious ceremonies are the same for all the members of this group. As among the Malabâr Brahmans in the midst of whom they live, the eldest son alone is entitled to marry. Though all *Pushpakân*s derive themselves from the same *Gôtra*, they freely inter-marry. Divorce is permitted and a *Nampûti* Brahman may be accepted as the second husband. For purposes of caste-government, they are one with the *Nampûti*s. For all ordinary ceremonies, they select priests from their own caste. The Brahmans, however, have *Uyatus* as their priests and follow the *maramakkathayam* law. The period of pollution is ten days.

Ampattan (21,826)—The barber caste is known as *Ampattans* in South Travancore and as *Kshatriyans* in Central and North Travancore. The caste is divisible into 3 classes, (1) Malayâlam-speaking *Ampattans* who follow the *makkathayam* law of inheritance, (2) Malayâlam-speaking *Ampattans* who follow the *maramakkathayam* law of inheritance and (3) Tamil-speaking barbers. There are also local varieties, such as *Pûlins*, a class of Malayâlam-speaking barbers in Central Travancore of Tamil origin. In dress, ornaments and festivals, the *Ampattans* do not differ from the Malayâli Sudras.

Ari (123)—Abbreviated form of *Ârya*, a small Tamil community confined to the southernmost taluk of *Porur*. Also called *Ditan*. By traditional occupation, the caste corresponds to the *Ampalanasi*. They perform all the Brahminical ceremonies under the guidance of Brahman priests, but they do not dine with Brahmans. The period of pollution is 15 days.

Aryappattar (31)—They are considered to be the descendants of the earliest Brahman immigrants from the East Coast into Malabâr. The caste now consists of a few families in the *Karunagapalli* taluk. The male members are requisitioned for tali-tying ceremonies in aristocratic *Nâyai* families. The males marry women of the *Pôtti* class. The girls are married into the regular *Âryappattar* family in the *Tinnevely* or *Madura* district. Malayâlam is the household tongue and in dress and personal habits, they are indistinguishable from Malayâli Brahmans. The dress of the girl is, however, changed into the Tamil form on the eve of her marriage. The *Âryappattars* recognise the *Nanipûti* Vaidikas as the guides and referees in all matters of caste-government.

Asari (62,882)—The name is synonymous with *Kammâla* and may denote any of the five artisan castes, but in Malabâr it is generally confined to the carpenter caste.

Atchakan (136).—It ranked as a sub-division of the *Nyra* caste.

Atal (9).—Literally *serra ta*. A class of *Ampala* *Atals*. They are usually the priests in temples devoted to *Bhadrakāl*. Their own caste-men are their priests. They wear the sacred thread. The death pollution lasts for 11 days.

Atyots (13).—Literally means *vassal*. Returned as a sub-division of the *Qimata* caste.

Bajys (142).—The chief *Talagu* trading caste scattered throughout all parts of the Presidency. It consists of two main divisions: *Dāsa* and *Pēta*.

Basta (178).—An immigrant caste of traders and money-lenders from Northern India. The name also occurs as a synonym for *Kōmāl*.

Bā (3).—A *Talagu* caste. Their traditional occupation is fishing and hunting, but they have largely taken to agriculture.

Brya (183).—The *shikari* tribe of the Deccan districts, corresponding to the *Valaiyans* of the *Tamil* country.

Brahman (55,613).—The members of this caste may be divided for ethnographic purposes into two groups of 5 sub-divisions each, viz., *Pancha Gaudas* and *Pancha Dravidas*. The latter comprises, (1) *Malayāla Brahmanas*, (2) *Tamil Brahmanas*, (3) *Talagu Brahmanas*, (4) *Kanarese Brahmanas*, and (5) *Malabarite Brahmanas*. Of the ten sub-divisions, the following have been returned at the 1911 Census:—(1) *Tamil* 40,325, (2) *Malayāla* 1,210, (3) *Nampūtiri* 5,105, (4) *Tulu* 2,143, (5) *Talagu* 910, (6) *Malabarite* 633, (7) *Kanarese* 291 and (8) *Gauda* 120. The *Nampūtiri* and the *Malabarite*, both indigenous to the country, are treated separately.

Chakkala (18,974).—A *Malabarite* caste of oil-pressers. Their customs and manners are similar to those of the *Nyars*.

Chakkilars (120).—Literally *Slaghya akkakar* or good speakers. The *Chakkilars* are a class of *Amravatis* whose traditional occupation is recitation of *Purāṇa* stories in temples. They correspond to the *Bātas* of the *Pāṇas*. They have their own priests, but the *Brahmanas* do the purification of houses and persons after pollution by birth or death. They give either marriage or service to the *Brahmanas* in return for alliance with *Nampūtiris*. The males become their slaves from among the *Nampūtiris*.

Chamar (10).—A *Bengali* caste of tanners and workers in leather.

Channan or *Shana* (166, 19).—A *Tamil* caste, more or less the analogue of the *Thavars* of the *Malabar* *Malapattanam* tracts. Agriculture and tapping of palm-trees form the chief occupations. *Nal* and *Gāṇṇal* are the usual title suffixes. About three dozen sub-divisions of this caste were cited at the Census of 1901.

Chakkilars (1,661).—A *Tamil* name for fishermen applied specifically to such of them as have retired to the sea for the sake of fish.

Chakkilars (3,221).—An indigenous caste of dyers. They follow the *makhatayam* law of inheritance.

Chakkilars (83).—A small caste of workers in lacquer.

Channan (91).—A caste of *Tamil* leather workers.

Channan or *Channan* (38).—A small caste of copper-smiths. They are distinct from the *Malabar* *Channans*.

Chetti (20,881).—Corruption of *Sruti* or the trading caste of south India. The caste is divided into 4 main sub-divisions, viz. *Kotta Chetti*, *Pakkai Chetti*, *Elai Chetti* and *Attai Chetti*. They resemble the *Tamil* *Sutra* in many of their customs and manners.

Chetti (70).—A small caste of weavers that probably immigrated from the *Malabar* coast.

Chetti (33).—This is a small caste peculiar to Travancore. Its customs and manners resemble the *Nyars*. Both males and females marry only within the caste.

Damapati (182) —Also called Brāhman Vide Ampalayāsi

Dasi (561) —Called also Devadasi, Devartiar or Devatir (servant of God), half Tamil and half Malayalam, attached to the South Travancore temples. They represent the singing and dancing castes of India and are generally consecrated to temple service. (For a fuller account, see the 1st Census Report, para 205.)

Dhangar (78) —A Marathi caste of shepherds and cattle breeders

Dhobi (52) —A name used for washermen by Europeans all over India.

Gidari (6) —This caste is found in many parts of India. The occupation of the members is the tending of sheep.

Gaula (259) —A caste of Kanarese cultivators and cattle breeders

Gosayi (209) —A name vaguely applied to pilgrims from Upper India constantly seen moving about in the south.

Gujarati (17) —A territorial name given to the immigrants from Gujarat. The members are mostly traders.

Hindustani (328) —A linguistic name returned by certain Hindu castes of North India.

Hoia (49) —A Kanarese caste. Occupation is agriculture, like that of the Pulayars of Malabar, the *h* in many Kanarese words corresponding to *p* in Tamil and Malayalam.

Ilammyan (6,116) —A synonym for *Sarukkutayan* (literally owner of an army). Mostly found in the Pattanam taluk of Travancore, and in the adjoining district of Unnevely. They are petty traders generally.

Ilaiyan (1,349) —Literally, "younger." The *Ilaiyans* constitute the section of Malabar Brahmins who perform priestly service for the Malayali Sudras. They have two endogamous sub-divisions, not functional but probably territorial—*Onam paraiyan* (first party) and *Kantam paraiyan* (second party). The *Ilaiyans* naturally resemble the *Nimpūyans* in respect of food, clothing, jewellery, festivals and ceremonies, though they form by themselves a distinct sub-caste. They have their own priests who perform for them the purificatory and other ceremonies. The caste government is in the hands of the *Nimpūyan Vudikas*. The *Ilaiyans* officiate in temples dedicated to Bhadrakali and the snake-duty and are the recognized *Purohitas* of the Malayali Sudras.

Irayan (6835) —The pastoral caste. It consists of two well-defined sections, the Tamil speaking *Irayans* who are apparently recent immigrants and the Malayalam speaking *Irayans* who are early settlers found chiefly in Central Travancore.

Izhavan (546,265) —Also known as *Chovas* in Central and North Travancore. The chief occupations are the cultivation of the coconut tree and the preparation of liquors from its products. They also distil toddy and distil arrack. The community generally follows the marumakkathayam law of inheritance. The forms of marriage, etc., are generally like those among the *Ilaiyans*. The community may be broadly divided into three classes—(1) *Pandi-Izhavas*, (2) the Malayalam speaking *Izhavas* or *Chovas* and (3) the *Tiyas* of British Malabar. (For a fuller account, see the notice in 1st Census Report extracted in the Indian Census Volume on "Ethnographic Appendices", pages 141—142.)

Izharattu (6,671) —The barbers of the *Izhavas*.

Kachchlu (270) —An immigrant Kshatriya caste.

Kadaya (7) —Unrecognisable.

Kahur (17) —A Bengal caste of boatmen and fishermen.

Kakkalalan (829) —A Tamil weaver caste.

Kakkalan (860) —The indigenous tailor caste of Malabar, now becoming reduced to the status of a wandering community. They are met with in North and Central Travancore and are identical with the *Kakkakuravans* of the South. There are among them four endogamous divisions—*Kavithan Marupparayan*, *Meluthan* and *Chattappayan*. The *Kavithans* are further divided into *Kollakkavithan*, *Malayalam Kāvithyan*, and *Pandi-Kavithyan*. They follow many subsidiary occupations, tattooing, boring the lobes of the ears and palmistry being the chief of them. Inheritance is from father to son. They bury their dead.

Kalkas (1,039).—A non-indigenous caste, regarded as a branch of the Kurumbas. They are mostly found in the bordering districts of the Madras Presidency.

Kallasari (7,993).—A sub-division of Malayalam Kammūlas, being stone workers by occupation (*Pūle Kammūla*).

Kallih (138).—A caste of agricultural labourers allied to the Cherumās or Pulayans.

Kannas (352).—Originally a Telugu-speaking soldier caste now mainly agriculturists, traders and land-owners. Gampa, Iluvellani, Godajati, Kavali V. durg, Pedda and B. nagaru are the chief sub-divisions of the caste. Widow marriage is not permitted. The bridegroom is in some cases much younger than the bride.

Kannamala (16,905).—The great artham class. It may broadly be divided into the Malayalam and Tamil Kammūlas. The Malayalam Kammūlas may further be divided into five separate classes—(1) *Āṣṭri* (carpenters), (2) *Māṣṭri* (barbers), (3) *Taṣṭri* (goldsmiths), (4) *Karuman* or *Kollā* (blacksmiths) and (5) *Kallan* or *Kalkal* (workers in stone). The system of inheritance is *makkathayam*. The Kammūlas burn the corpses of adults and bury those of the young. They observe pollution for 15 days. One of the sons observe *diksha* for a year on the death of the father. *Pādiki* and *Kasakian* are the titles of the Malayalam Kammūlas. Tamil Kammūlas are divided into three territorial groups, *Pandya*, *Chozha* and *Kongan*. This class like the Malayalam Kammūlas may again be divided into five occupational sections, viz. *Taṣṭri* (goldsmith) *Kannan* (brass smith) *Tachchan* (carpenter) *Kal-tachchan* (stone mason) and *Kollan* or *Karuman* (blacksmith). Unlike their Malayalam brethren, the Tamil Kammūlas wear the sacred thread and own the Brahmanical *Gōtras*. In their marriage rites, they closely imitate the Brahmans. Death pollution lasts for 15 days. They are mostly Śaivites in religious worship. [In connection with the Census, memorials were received on behalf of the Kammūla caste that they should be shown in the Census schedules as *Varna Brahmans* and not by the ordinary caste appellations indicative of their usual occupations. They state that their place in society is not governed by occupation, the five sub-divisions of the Kammūlas freely intermarrying with each other and refer to support of their claim, to the tradition which traces their common origin to *Vivakarma*, a Brahman, the reputed father of Indian architects.]

Kakkiras (4,044).—Also called *Kiṣṭ*. They form one of the hill communities of Travancore and are a dark, strong people of medium stature and active habits, quiet and simple, carrying on migratory cultivation, and living mainly by hunting and on forest produce. The word, *Kakkikaran* means hereditary proprietor of land and points to the ancient distribution of population between plain and mountain mutually dependent for husbandry and plough produce respectively. The growing and rearing of forest trees, the collection of honey and wax and other hill produce the capture of elephants and other wild animals were the established hereditary occupations of the hill population, just like the agricultural and other industries of the plains, and like them subject only to the payment of tax to the king. The *Kakkir* together with small clans under a *Mittaṭṭi* or headman. At the Panchayat, all social questions are discussed and settled. The system of inheritance is mainly *makkathayam*. The approval of the village council is obtained prior to marriage. Widow marriage is allowed and divorce is permitted but all these are very rare. The *Kiṣṭ* are characterized by a high standard of domestic labour and social helpfulness and, in their unsophisticated purity they are truthful to a fault.

Kanjiyan (11,987).—This caste consist of two endogamous sections—*Kanjiyan proper* (*Tṇi Kanjiyan*). The members of the former section follow only the astrological profession. The latter are engaged in umbrella-making and spirit-exorcising. They observe both the *Uṣṭi* (*Uṣṭi*) and the *Sambarudhi* ceremonies. The marriage of widow is allowed. The dead were formerly buried now the dead are cremated.

Kannadwa ().—A Kannaṇṇu caste of shepherds and cattle breeders.

Kannu (3,211).—The members of the Kammūla caste who work in brass and copper.

Kanṇi (41).—A small hill-tribe. They speak corrupt Tamil and belong more to the Chelva than to the Travancore.

Kanṇi (11).—A small hill-tribe. They are makers of oil and are known as *Kanṇi*. The dead are buried. *Uṣṭi* (*Uṣṭi*) and *Sambarudhi* are their titles.

Kanṇi (71).—A small caste of the South Travancore.

Kanṇi (11).—One of the hill-tribe.

Kaundan (690) —A title used by Konga Vellāḷis, Kurumbans, etc

Kavalkkarian (49) —A term applied to a class of village watch-men

Kavarai (572) —The trading caste of old Telhanganā or Andhra-rāṣṭra (Telugu country). They both manufacture and sell. Their chief article of trade is bangles. Among them now are also spinners, painters, dyers, etc. The former take the name of Chettis, and the latter are called Nāyikkans and wear the sacred thread.

Kurati (5,946) —The barber caste that generally functions for the Shāṅkars.

Koli (296) —They are an Oriya-speaking class of weavers, traders and agriculturists.

Kollan (26,659) —The members of the Kammāḷa caste, who work in iron (*Vide* Kammāḷa).

Komatti (197) —The great trading caste of South India. Their original home is old Telhanganā and their mother-tongue is Telugu. They have also a secret cipher language for trade purposes. Those living to the north of Vizianagaram form the Gavara section, while those to the south of it form the Kalinga section. The Gavaras and Kalingas do not intermarry. The Kōmattis apparently represent the old Vaisya caste of the Indian social polity. In respect of the age of marriage and of the re-marriage of widows, they do not differ from the Brāhmins. The right of claiming the maternal uncle's daughter is freely exercised among the Kōmattis. They wear the sacred thread and recite the Gāvatrī and other sacred mantras. All the sections except the the Langyats cremate the dead. Their caste suffix is Chetti, which is said to be a corruption of Śrī-hiti or respectable person, evidently in indication of the vital place in society of their commercial function.

Konkani (10,219) —An immigrant community long settled in Travancore. Trade is their general occupation. Several families earn a livelihood by making *parpatams*, a condiment in almost universal favour in Malabār. Ordinarily, they dress themselves like the people of Malabār and, on religious and festive occasions, like the East Coast Brāhmins. The Konkans have their own temples of which there are a dozen in Travancore. The caste is divided into several endogamous divisions or Gotras. Custom enjoins that, as far as possible, a Konkani should marry his maternal uncle's or paternal aunt's daughter. The marriage ceremonial presents but few differences from that of the Brāhmins in general.

Konnan (21) —A caste regarded as a sub-division of Kammāḷa.

Kotippattan (120) —A small community of Tamil Brāhmins indistinguishable from them in general appearance, customs, etc., who fell into a state of social isolation from the rest of the Brāhman community on account of their having taken to a non-Brāhmanical occupation, i.e., the growing of the betel-vine. Of course, the formation of this caste is traceable to a period when the caste structure was a living one. They do not study the Vēdis, and the Gāvatrī hymn is to be recited without the first syllable (*pranavam*). The cremation at funerals is unaccompanied by any mantras or any rites. From the long exclusion from the rest of their class and continued living in the midst of the indigenous Malabāris, Malayāḷam is the home language of the Kotippattin.

Krishnanvaka or *Krishnan vakakkār* (10,429) —The caste name literally means "belonging to Krishna", the pastoral incarnation of the Hindu theology. They are in Travancore particularly confined to the southern taluks of Erancl and Kalkulam. Some follow the makkathayam law of inheritance, while others follow the marumakkathayam. The former generally resemble in customs and manners the Vellāḷis, and the latter the Nāyars. Tattooing was very common among women, but is now going out of fashion, as among all castes.

Kshatriya (1,165) —The protecting caste of the Indian social organism.

Kshatriya, Malayala (2,025) —Under this specific name are included, in Malabār, (1) Rājās or Timpurāns, (2) Kōli Timpurāns, (3) Tampāns and (4) Tirumulpāns. (For a detailed account, refer to the 1901 Report.)

Kudumbo (29) —Kudomo or Kudumbo is an Oriya caste of cultivators.

Kudumi (3,207) —Kudumis are the Kōḷiṅga Śāḷis. Like the Ampalavāsīs of the Malabār temples, they engage themselves in accessory duties at the shrines of the Konkans. They

are divided into two endogamous divisions, Māppan and Itayan. Both speaking, the manufacture of fireworks is the occupation of the former caste, and the preparation of beaten rice that of the latter. The system of inheritance is generally makkathayam. Girls are married while young. Except in the case of person below 16 years of age the dead are cremated. Death pollution lasts for 15 days. The Kadamba have their own priests for ceremonial purposes but have no separate temples.

Kalura (87).—A small Telugu-speaking wandering caste found in the Tanjore District and in the Tinnevely District of the Madras Presidency. The catching and training of snakes is a speciality with them.

Kumbi (123).—The Kumbis are potters by occupation from *kumbha*, a pot or vessel. They form a sub-division of the larger Barava caste.

Kuravan (61, 827).—A large community chiefly engaged in agricultural labour. They are divided into several classes, the chief of which are the Katakurnas, the Kakkakurnas and the Kakkikurnas. The first is the most important sub-division. They follow the maramakkathayam system of inheritance and both the tālakkettu and varambatham ceremonies go through. Polygamy obtains among them. Divorce is permitted, but requires the previous consent of the elders. They bury the dead and observe pollution for 16 days.

Kuruvai (1,374).—A tribe of Ampala Hills, said to be the descendants of Tamil immigrants brought in for temple service. The system of inheritance is maramakkathayam. The dress and ornaments are like those of the Vēṇṇāṭṭa caste. Government is in the hands of the eight trustees (yogakkāris) of the Śrī Jaganmūlā Śaiva temple. The *avai* as, such as *śūmakarava* etc. are performed by the family priest. The marriage ceremony or the tālakkettu of the girl is performed between the ages of 8 and 12. It is the person who ties the tālakkettu to live with her as a husband and continues so. After this, her son observes pollution and makes funeral offerings. No punishment or alms is observed; but in its place the pūjakkettu ceremony of the Vāyara is celebrated. Death pollution is observed for 12 days.

Kuruppu (223).—A synonym for Kāṭṭiyar. The term Kuruppu is also a title of the Vāyars and means "teacher" of fencing and other practices included in physical culture.

Kutai (7).—An occupational name means a (rope) dancer.

Kuzava (3,307).—They are Tamil potters professing both Śaivism and Vēṇṇāṭṭa. They wear the sacred thread and their ceremonials are like those of the Vēṇṇāṭṭa. A Kuzava generally claims the hand of his paternal aunt's daughter. Marriage takes place before puberty. Divorce and remarriage are permissible on mutual agreement. The Kuzavas are considered to be adept in house-keeping.

Kuzavar (102).—Also styled Kāṭṭiyar. They imitate the Vāyara dress and jewellery and follow the Vāyara manners and customs. They are good hunters. They carry on plantation work in the hills.

Kuruvai (92).—One of the hill tribes.

Malakut (201).—A hill tribe.

Malappan (101).—One of the hill tribes.

Malappan (1).—One of the hill tribes. Regarded as a lost tribe. They speak a mal language.

Malakut (34).—One of the hill tribes (Vēṇṇāṭṭa).

Malakut (103).—One of the hill tribes. They live in the foot of the hills and are employed by farmers to guard their crops from the attacks of wild beasts. They worship and make offerings to Hindu shrines. They bury their dead. Their implements are bill hook, bow and arrow.

Malakut (141).—A hill tribe.

Malakut (300).—A hill tribe.

Malayarayan (2 612)—One of the hill tribes, speaking a corrupt form of Malayâlam. Their marriage ceremony is simple. After the bride and bridegroom have eaten from the same leaf, the tîli is tied. With a few exceptions, makkathayam is their law of inheritance. They are superior to all other hill tribes in appearance but are generally short in stature. They are good hunters. Birth pollution lasts for a whole month for the father, and for seven days for the mother. The dead are buried.

Mali (34)—A non indigenous agricultural class whose traditional occupation is making garlands and providing flowers for the service of temples. Those engaged in temples wear the sacred thread and seek the priestly office of Brahmans. The Mîlis permit widow marriage, and a younger brother often marries the widow of the elder brother. The dead are cremated and pollution lasts for ten days.

Mannan (H 9 946—A 1,239)—One of the hill tribes found also in the low country. They are said to have been originally the dependants of the Pandyan kings of Madura and resemble the Maravans in dress. They bury their dead. The language of the Mannâ is Tamil. Widow marriage is permitted. Mannâ is also the name of the washerman caste.

Marakkan (14,604)—The only Hindu fishermen now in Travancore, found especially on the sea-board between Quilon and Alleppey. Though a people isolated by occupation, locality and even sympathy from the Hindus living inland, they are a sturdy and industrious lot. They have their own temples, their women assiduously work at coconut fibre and yarn, and with some responsible support and guidance, the Marakkâs would make a fine community by themselves. They observe both tîlikettu and sambandham marriages.

Maran (29,318)—One of the functional groups of Malabâr. They are the players of musical instruments. Socially they are divided into four classes—(1) Orunûl, (2) Irunûl, (3) Chîppûl and (4) Kûlun. Among the first class, the person that ties the tîli is the rightful husband, in whose default no second Mârân can be accepted. But in regard to the second class, the tîli-tier is not necessarily the husband. There are also other sub-divisions based on territorial and occupational differences. In manners, customs and ceremonies, they resemble the Nâyars.

Maratti (4,471)—The term now denotes the various Mulirattu non-Brahman castes who are mainly agriculturists, but were once a military class.

Maravan (8,376)—Originally a police and military caste. They are found chiefly in Madura and Tinnevely, and in Travancore, in the outlying taluks of Nânehînûl and Sheneottal. Besides being village watchmen, some of the members of the caste have too often taken to village raiding and highway robbery, presumably under stress of want added to lack of educational guidance. Under favourable conditions, they have like several other professional castes taken to agricultural occupation and are some of them the most expert cattle breeders in the Presidency. Widow marriage is allowed and practised except in the Chembungattu sub-division. The Maravas practise both burial and cremation.

Marrali (61)—Returned at the Census as a name for Mârwalî, which is a territorial name meaning a native of Marwar.

Mochchi (9)—A Marathi caste of printers and leather workers. In Mysore and parts of the Ceded Districts, the term Mochchi refers to the Marathi speaking workers in leather. The name is also applied to the Telugu speaking people called Râju, Jinigara or Chittirakâra who are mainly engaged in printing, making toys, etc., and do not deal with leather at all.

Mulluan (1,742)—A caste which according to a probably erroneous tradition came originally from Ceylon. They follow both marumakkathayam and makkathayam laws of inheritance. Fishing is their traditional occupation. They are also lime makers, palanquin-bearers and boatmen. Girls are married after puberty and divorce is permitted.

Mutali (555)—A titular name used by Vellalas, Kakkalavans, etc.

Muttatu (615)—Literally elder. Their manners, customs, and ceremonies are like those of the Malayâla Brahmans. The Mûttatus are custodians of temple properties, especially valuables, and go in priestly charge of the Sîgam in all processions at Utsavams, etc., in several of the chief temples in the State. They are believed to be Malayâlam analogues of the Nampians or Sîadvigas of

the Tamil country. In the ancient temple of Sothil, near Travancore, a Hindu deity is known as *Itattal* and is identified with the goddess of the Tamil country. It is also identified with the goddess of the Tamil country.

M. latus (399).—One of the hill tribes supposed to have immigrated from the Kingdom of Madura. They speak corrupt Tamil. The males dress like the Malays of the low country. A larger than an ordinary variable portion of their toilet. Migratory hill-cultivation is their occupation. The prevailing form of inheritance is marum kakathayam.

Word (1345) — This is Tuguthi earned by many non-Brahmanical castes, B E J
Basta etc

Nallan (12739) — A title used by *Nallas*, *Bilijas* and many other Telugu castes. The caste *Nāḷḷan* returned as a sub-division of *Paḷḷ*.

Amphib. 134)—They are of two kinds, those that wear the sacred thread and those that do not. The inheritance in both cases is in the female line. Pollution is observed for two days.

A *nephar* (1918) —A class of Ampah *gis*. The members do not wear the sacred *ti* ead. The women are called *Ni gi gi* and contract the sambandham form of *blance* with their own or other men, *Nampitius*, *Tumulpis* or *Chylykya*. The term *Nampis* is also applied to the *Pahpaka Nampis* *Nipra Nampis* —so called from having once been chiefs of territories—and *Ti gi Nampis* or *Ti gi Nampis*.

Nampuris (5,105).—Nampuris form the socio-spiritual aristocracy of Malak and are the traditional rulers of Paras Aras Land. There are five sub-divisions among them viz. (1) Timpal (2) Akkas, (3) Vithala Nampuris (4) Samayya and (5) J. (6) J. The first forms with the second an honourable community. The form of inheritance is patriarchal. The eldest male member inherits the property. The marriage is restricted to the eldest son, while the other sons are engaged but do not contract formal connections with Nampuris. The Nampuris are strictly *paria*, and appear by screening behind their caste umbrella and working as ind-servants. As among Brahmans generally the widows do not remarry. Girls married after puberty.

Fig. 16—A small bill—The

Nayars (97 183)—Nayars are the most numerous of the non-Dravidian Hill-dwellers. They form imports commonly with agriculture as their chief occupation. They once formed the militia of the country and the army of the Travancore Kingdom still solely recruited from their ranks. As to their occupations. It is equally necessary for social history to signify that they are essentially a caste and seem to have determined many of their original beliefs. (For fuller account, see the notice in the Census Report of the India Commission—“Ethnographic Appendixes” Pages 131-110)

Nayan (H-31 - A 11) - Agh nting east of the West coast. The Nayan f are excellent but
but occupy very depressed rank in society. The idleness with which they live and po-ly
them notice of it at re and pol it on illud d prosperoo put. They bear death well
than for ten d s.

VI (3373) A small lot of dried green tea, grown in cultivation, found chiefly in the district of Nyaung-U, Mandalay and Tada-U, Mandalay.

[illegible]

On (101)-The Telephone Agent found that the
 (111) no one had been with the family on the day of the
 (12) was engaged only in the telephone call.

about in groups with their families, and from their precarious mode of existence, often present a sad spectacle

Pallar (11,222) —The agricultural labourers of the Tamil country As a fair sample of the absurd derivation of caste names, which one often meets with, it may be mentioned that Pallars are derived from *Pallam*, a pit, so called, it appears, because "they were standing on low ground when the castes were originally formed!" The Pallars are Saivites Their chief worship is of the necessary deities of Siva or Bhûtaganas, mis-called devils To the Hindu, Siva is God or Îsvara in his capacity as the negative or destructive force of the universe, so necessary for the maintenance of the positive force, and the Bhûtaganas, depicted in form corresponding to the function, have come to be looked upon as powers of evil or D'evils, or Devils with the apostrophe off

Panan (3,316) —The word is of Tamil origin and means a tailor This is the chief occupation of pânnâs, though in British Malabâr exorcism is largely practised by them Inheritance is mostly patriarchal The dead are buried, and death pollution lasts for sixteen days

Panchaman (3,027) —Panchama (or fifth caste)—another name for Parayas Having become a depressed class, the Parayas naturally loathe the class-name with which is associated all that depression and have probably returned themselves as Panchamans The tendency to reject a class-name, however unexceptionable, and even to resent its application under the circumstances such as the above, is evident from the fact that the term Vaidikan, which really means one who is learned in the Vêda and acts in conformity with its ordinances, would, in the depressed condition of the average Brahman priest of to-day almost indistinguishable from beggary, be resented, if applied to a learned and pious Brahman who is not guilty of living on the Brahmanical profession

Panikkan (718) —A disorganized caste, the members of which follow occupations of all sorts, weaving, agriculture, trade, etc

Pantaram (H-13,784) —The name generally applied to a sect of non-Brahmanical Saivite devotees supposed to have taken to the fourth Ârama or stage of life, i.e., that of the Sanyâsi God Subrahmanya is their favourite deity The caste has a number of sub-divisions Several of the way-side rest-houses and water-sheds—the benefactions of an age of greater plenty—are under the care of Pantarims The Pantarims, as a rule, do not allow their widows to marry The dead are buried in the sitting posture, as if to represent the Samâdhi of the Sanyâsi who is also interred in that posture

Parava (9,313) —The caste that deals with shells, ranging from those of the pearl oyster to ordinary lime-shells The Tamil speaking Parivas follow the makkathayam, while the Malayi-Mini-speaking sections follow the marumakkathayam law of inheritance and other Malabar customs and manners

Paraya (70,554) —An important but depressed caste of agriculture and industrial labourers—matting and wicker-work being their speciality—found throughout Travancore, but especially common in the more southern taluks There are several sub-divisions among them They differ in customs and do not intermarry The marriage of girls before puberty is very rare The widows are allowed to marry As a rule, the dead are buried The great South Indian Saint, Nandan, was a Paraya or agricultural field-labourer and evidently lived in an age when caste degeneracy had long ago set in

Patnûl (3,292) —A caste of silk weavers They are the descendants of old immigrants from Sourâshtra, one of the extinct political divisions of ancient India Having migrated to a country where silk cannot be had, the Patnûlkars (silk-thread-men, etymologically speaking) have taken to weaving cotton Their chief centre now is Madnra Though they still count among themselves several wealthy people, the Patnûls have, as a class, suffered greatly from external competition

Patnyan (16) —A sub-division of Palyan, a caste found on the Palni hills and the adjoining hills in Tinnevely

Pitappalli (75).—A class of Ampalavāsis, confined almost to Travancore. The members follow the matrilineal system of inheritance. The period of pollution is, as in the case of Brahmins, ten days.

Pisharati (331).—A class of Ampalavāsis. Those to the north of Quilon are called Pisharatis and those to the south, Ashtāsis or Tekkan (southern) Pisharatis. They do not wear the sacred thread. They have their own priests. Girls are married before or after puberty. Pishagabara or the taking of the bride's right hand is that of the bridegroom is the most important portion of the marriage ceremonial. The bridegroom himself ties the tūli. On the fourth day is the consummation of marriage. The funeral ceremonies resemble those prescribed for Śaṅkṣād. Inheritance is in the female line, but may be patriarchal by special compact. The traditional occupation of the caste is to prepare garlands of flowers for Vaiṣṇava temples.

Pott (2,390).—A small class of palanquin-bearers. They are in dress, manners, customs and language, entirely Tamilians.

Potti, Malayala (*210).—Applied to all the Kēraḷa Brahmins who do not come under the specific designation of Nampūtiri. There are two main classes—(1) those who originally settled in the southernmost hitherto divisions into which Kēraḷa was formerly divided and (2) the immigrants from Canara who gradually became assimilated with the general body of the Nampūtiris, in habits, manners and custom. The seven families of Śhāntatīl Pōtti (the original trustees of Śrī Padmanābham temple at Tiruvandram) and the Paṭṭhatṭa Pōtti (the Priests of the Travancore Royal family) come under the first division. The second comprises those who are called the Tiruvalla Deva. Under the patronage of the West coast Kings, the Pōtti Brahmins still pursue their appointed religious occupation, which is chiefly priestly service at temples. But with them too, the occupation, on account of its low wages, is more one of habit and necessity than choice and free-will. Their laws of inheritance, their social ordinances and appellations, their songs and recreations are the same as those of the Nampūtiris.

The term Pōtti is also applied to the Tala Brahmins of the taluka of Uppinangadi and K. market in South Canara, who are merely temporary settlers in Malabar for purposes of temple service and do not count in the indigenous population of the State. There is visible now tendency to submit to these lotus for Pottas and Nampūtians in the temples of the adjoining District of Tinnevely.

Potaval (117).—A class of Ampalavāsis meaning literally a general servant. The name indicates the miscellaneous nature of the temple duties assigned to the members. There are sub-divisions—Majappotaval (maker of garlands) and Cherappotaval (drummer). See also Ampalavāsis.

Palayam (185,314).—The Palayams correspond to the Cheruman or Cherumankal of British Malabar. They are divided into a number of sub-divisions, kaappalayan, Vetti-palaya, kaakkappalayan and Inappalayan being the chief of them. According to certain accounts, they represent the most depressed layer of the comprehensive industrial cast of India, and their function is the organisation of agricultural labour. In many cases they are hereditary attachés to princely households. Their main chief object of worship. They also reverence the spirits of the deceased. The marriage of a male takes place before he is 20 while girls are wedded either before or after puberty. The dead are buried and pollution lasts for seven days.

Pilāṇ (1730).—The Pilāṇas are the astrologers, medicine men, priests and singers in Kēraḷa. The system of inheritance is matrilineal (father to son). In other respects they are like their fellow-castes of Malabar. They bury their dead.

Puliyal (1).—Unrecognisable.

Pūjaka (1,920).—A class of Ampalavāsis. A thel name (pu-jam or flow) is that they are purveyors of flowers and g. land for the temples. Pūjakan who live in the south of E. The Karthikapalli taluk are called Pūjapūj. The Pūjakan, together with Nampūtians and Brahmins, constitute the Pūjaka-group of the Ampalavāsis caste. The social and religious ceremonial are the same as those of the members of this group. The chief occupation is to be accepted as a second.

husband Their socio-religious, or caste, government is in the hands of the Nampūtiri Vaidikas They observe pollution for a period of ten days—(Vide Ampalivāsi)

Rajput (304) — Known also as Thakur (lord) or Chhatra, the modern representative of the ancient Kshatriya, being found mostly in Northern India

Raju (272) — A Telugu caste of agriculturists They are chiefly found in Undrapah and North Arcot They are generally Vaishnavites and are served by Brahman priests Their customs are mostly Brahmanical

Reddi (833) — The great caste of cultivators and farmers in the Telugu country They are also known as Kāpus

Sadhu (54) — The term means, meek or quiet Applied to ascetics or Bhrāṅgis

Saṅghakurukkal (49) — The non-Brahmanical priests of the Śiva community among the Tamil Sudras.

Sakkilyan (1,669) — The leatherworkers of the Tamil district, corresponding to the Madigas of the Telugu country Girls are generally married after puberty. The bridegroom is sometimes younger than the bride Their widows may remarry. Divorce is permissible The marriage ceremony closely resembles that of the Parayars

Sallyan (9,919) — The Sāliyars are a Tamil weaving caste

Samantan (733) — Immigrant from the Northern parts of the Malabar coast The chief sub-divisions are—(1) Atiyōtis, (2) Unyātiris, (3) Pāntals, (4) Erītis, (5) Vellātis and (6) Nē-tāngatis They are exogamous divisions The Sāmantas are, of course, guided by their Brahman Vaidikas in socio-religious matters Inheritance is in the female line

Silpasari (104) — A sub-division of the Kammāla caste Their occupation is sculpture and stone carving

Singalese (4) — A linguistic name, applied to the Natives of Ceylon.

Suyali (27) — A sub-division of Dāsari, numerically the strongest of the Telugu pilgrim class

Sunois (25) — A class of Sunri Their occupation is the distillation and sale of liquor

Talaran (1,889) — A title of the Maravans Jati or Jati Talaran is the name of the hereditary chief of the Paravas of Tinnevely, who at times of pearl fisheries receives a fixed share of the oysters

Talayan (425) — A caste allied to the Chāṭṭans Tattooing is very common among them Their chief occupations are hunting and hill cultivation The system of inheritance is from father to son

Tantan (21,641) — The caste is mostly found in the taluks of Chirayinkul, Quilon, Karunagapalli, Kattikappalli and Mavelikara Also known as Urali to the south of Varkal, and as Mutal-pattukar in several places to the east of Kottarakkara Males and females have respectively the titles, Mūppan and Mūppatti The Tantalans are divided into four endogamous sections, called Ilungu, Puvur, Irunelli and Pilakkuti Tattooing is very popular among them In food and drink, they resemble the Izharans Their priests are known as Tanti Kuruppus and, as among certain other castes, do for them the chūra or shaving service In fact, the latter would seem a sacramental duty The ceremonial rite of shaving at a Brahman's tuft ceremony is gone through by the father to the accomplishment of mantras, the professional barber coming in only later on, to effectively close the operation Sambroddham or the actual Malabar marriage takes place after puberty The eldest member of the family is cremated The rest are buried Death pollution lasts for ten days

Tattan (21,550) — The goldsmith section of the Tamil and Malayalam Kammālas (See Kammalan for farther information)

Telugu (25) — This is a vague linguistic term, indicating one who speaks the Telugu language It has been returned as a sub-division of various classes, e.g., Agras, Balija, Bedar

Tiyattunri (259) — A class of Ampalivasis Also called Agnithirar Their system of inheritance is patriarchal The members resemble the Pushpakam caste in several essential particu-

lara. They observe ten days pollution. In the temple of Bhadrakālī and in Brahman and Kshatriya houses, they are engaged for waving off the effects of the evil eye.

Telugu (592).—A distinct caste of Telugu culttors, probably the descendants of paligars and soldiers of the Vakkir kings of Vijayanagara. They are usually married to their paternal nieces or granddaughters, and age-differences do not very much count. Their women do not eat even in the houses of Brahmins. The dead are buried. They are noted for their power of curing snake-bites by magic incantations.

Udan (28).—A Hindu pilgrim class.

Udatus (H-3 974. A 141).—A Hindu caste found in the low country as well as on the hills. They lead a shifting life. The Udatus are marumakkathayans.

Uppara (154).—A old salt-making caste, now defunct and engaged in profitable labour of kinds, such as, tank-digging, cultivation, etc. They marry after puberty. Widows remarry but a widow may only marry a widower and never a son.

Urah (5,738).—A historic hill-caste claiming a renowned past. They are good hunters and watchmen. Their recollections are very good. They strictly observe touch-and-distance pollution. Marumakkathayam is the prevailing form of inheritance. Remarriage is permitted. The dead are buried. They bear their loads on the back and never on the head.

Urulan (187).—A caste regarded as a sub-division of Urah.

Urarri (1455).—Regarded as a sub-caste of Parathim. They usually serve as priests in the temples of minor deities not generally worshipped by the Brahmanical classes. They are also engaged as temple watchmen.

Uyaya (126).—The great exchange caste of Indian society. Few people are known by the generic name of Uyaya, unlike the other three castes of Brahman, Kshatriya and Śūdra.

Vala (16,749).—A fishing caste. They observe the takshig and the sambadhana ceremonies and resemble the Malabar people generally in other respects. Found mostly on the margin of the backwaters in Central and North Travancore.

Vela (253).—A small caste whose occupation is the sawing of wood. The name is derived from *vel* meaning a saw.

Vellans (912).—The priests of the Parayan. They are also engaged as astrologers and physicians and consulted by all classes of people.

Vellayan (16,235).—A corruption of Vāṇiyyam or trade. The Vellayans are now both oil pressers and sellers.

Vellans (2,620).—A Tamil caste of washermen.

Vellars (2,762).—A class of Amprakshas, whose traditional occupation is cleansing, making of gulari and other miscellaneous temple service. The Vellars are subdivided into 8 classes—(1) Ōḍḍuk Vāriyar (2) Takkumkūr Vāriyar (3) Vakkumkūr Vāriyar (4) Rayattattuk Vāriyar (5) Vellam Vāriyar (6) Mūḍa Vāriyar (7) Paṇippura Vāriyar and (8) Chēḷayal Vāriyar. With the exception of the Ōḍḍukara sub-division, they follow the matrilineal system of inheritance. There are two distinct types of marriage in vogue among them—(a) *keḷakalyāṇam* like that of the Vāiyars and (b) *Kunikkal* (with girl in home) which confers full rights on the wedded wife and her line. A Vāriyar performs Śrāddha for his parents and for his maternal uncle.

Vellu (106).—Corresponds to the Vellu of the Telugu country.

Vellam (116).—Literally spear men from *vel* (spear). The word is derived from *Vel* (spear). Some of the Vellans are found in the hills and go by the name *Mūḍa Vellam*. The Vellam perform a number of useful services to the body politic of Malabar. In the Kōḷapattil, their duty is said to be the naming of women in their existence till the child is a *śūdra* *hāmayya* exercises, change of teeth, and washing of clothes are also mentioned as their occupations.

Vellu (158).—A potter caste found chiefly in Central Travancore.

Vellu (1949).—They are the great farmer caste of the Tamil country. The Tamil word *Vellam* is derived from the word *Vel* (water) and *ma* (man) (see 1).

meaning cultivation. In religious observances, they are generally strict. They abstain from both intoxicating liquors and meat. The Vellâlas have four main divisions—(1) Tonda mandalam, (2) Chôzhiya, (3) Pândya and (4) Konga. Marriage is either infant or adult. They burn their dead and observe fifteen days' pollution. All of them perform Srâddhas to their departed parents.

The Nanchingâl Vellâlas are peculiar to Travancore. They are believed to be the Vellâlas above referred to, who have, by long residential contact with their Malayâlam-speaking brethren, the Nâyars, adopted some of the customs and manners of the latter.

Veluttedan (11,356)—The washerman caste of Malabâr. In the matter of food and drink, in the details of their marriage rites and also in their dress and ornaments, they resemble the Nâyars.

Vettuvan (H-1,482 -A-4)—A field-labouring class. This is also the name of a hill-tribe of shikaris (hunters) and collectors of forest produce in Malabâr jungles.

Vîlkuruppu (986)—The priests of the Malayâlam Kammâlas. They are also makers of bows and arrows.

CHAPTER XII.

OCCUPATION

(TABLES XV AND XVI)

Scope of the Return

181 In the order of Chapters for this Report, Occupation comes last. It winds up the life-history of the people during the decade that it purports to chronicle, by showing how each unit is enabled to exist. The wants of man are many, and social life is a life of exchange. In organized or civil society, with distribution of function and differentiation of structure, say, under the Indian caste system maintained in proper order, the name of a person's caste-division would be the name of his occupation, the number in each caste-division would be the number engaged in that occupation and the quantity produced would, when the organism is well-balanced by the laws of supply and demand, be in proportion to the total number of units in the organ of that organism. As the individuals of each occupational caste-division would, as part of their structure, allot to themselves a fixed residential locality, the counting of the families and their members would be comparatively a very easy process, and may be undertaken at much less infrequent intervals than now. However, there can be no denying that even a decennial Census has a great value and that the value rests essentially on the occupation figures. Life is food, and food depends on labour or occupation. Detailed information, therefore, in respect of occupation is of the first importance, as disclosing the exact situation of a society, as indicating the effects of the forces at work and as suggesting directions for future activity. In the treatment of this vast subject, an attempt will be made to narrate the main features of the statistics and notice some of the details connected with important occupations. A few observations on the industrial conditions and general outlook will conclude the Chapter.

182. With each Census, the scope of the information recorded and compiled has been widened, and it deserves to be remarked that the 1911 Census represents a noticeable advance over all its predecessors. In 1901 the occupations were recorded in three columns of the schedule—9, 10 and 11. The first showed the means of livelihood of the people actually engaged in earning them, while the last gave the number of persons who were dependent on these workers. In column 10 were returned the auxiliary occupations, if any, followed by those in column 9 in view to supplement their income. The Tables compiled related to (1) the principal occupations of actual workers against which were also entered the number of persons who followed agriculture as an accessory occupation, (2) the subsidiary occupations of agriculturists, and (3) the non-agricultural subsidiary occupations of actual workers other than agriculturists. At this Census, the three columns above referred to have been retained and Tables compiled therefrom, as detailed in the next para. A Table has also been prepared to show the distribution of occupations by religion. As explained in the Introduction, the sphere of the Census was specifically extended to industries pursued in factories as well as at the homes of the workers. A Census of cattle was also taken.

183 The statistics of occupation are embodied in Imperial Tables XV and XVI. The former consists of five parts showing (A) the occupations or means of livelihood of the total population, (B) the subsidiary occupations of agriculturists, (C) certain mixed occupations with the strength in each (D) the distribution of occupations by religion and (E) particulars of factory industries. Table XV A is the main General Table and records the occupations by Class, Sub-class, Order and Group for the five Administrative Divisions. To this is appended an auxiliary Table in which the Administrative units are grouped into the two Natural Divisions, and figures are given for the latter by Class, Sub-class and Order. Part E is divided into four sections—(1) summarising the industries for the State as a whole, (2) showing the industries by Administrative Divisions, (3) giving particulars in regard to ownership and (4) stating the race or caste of the managers of the different industries. In view of the importance of the subject, tank details are embodied in the Provincial Volumes which also records the occupations shown in Table XV A, by "Orders." Table XVI gives the occupations followed by selected castes. The statistics relating to home industries and cattle are incorporated in the Provincial Volume.

The Subsidiary Tables appended to the Chapter serve to illustrate the salient features of the statistics. They are—

Subsidiary Table I—General distribution by occupation.

Subsidiary Table II—Distribution by occupation in Natural Divisions.

Subsidiary Table III—Distribution of the agricultural industrial commercial and professional population in the Natural and Administrative Divisions.

Subsidiary Table IV—Showing occupations combined with agriculture where the latter is the subsidiary occupation.

Subsidiary Table V—Showing occupations combined with agriculture where the latter is the principal occupation.

Subsidiary Table VI—Occupations of females by Sub-classes, and selected Orders and groups.

Subsidiary Table VII—Showing the strength and variation in certain selected occupations, between 1911 and 1901.

Subsidiary Table VIII—Giving the occupations of certain selected castes.

Subsidiary Table IX—Distribution of occupations by religion and of religions by occupation.

Subsidiary Table X—Showing the employees in certain special Departments.

Subsidiary Table XI—Distribution of the urban population by occupation.

184 At this Census, a new scheme of classification of occupations has been followed. It is based on the one drawn up by Monsieur Bertillon and recommended by the International Statistical Institute for general adoption and renders possible the comparison of the statistics of different countries. The main features are claimed to be its logical arrangement and its elasticity which enable it to be used in countries at all stages of industrial development. While the Classes, Sub-classes and mostly the Orders of that scheme have been maintained with little change the sub-division of the Orders into groups has been made out with special reference to local conditions.

CLASS	SUB CLASS	Nomenclator	
		Orders	Groups
A — Production of raw materials	I — Exploitation of the surface of the earth	1—2	1—15
	II — Extraction of minerals	3—5	16—20
B — Preparation and supply of material substance	III — Industrial occupation	6—10	21—23
	IV — Transport	20—23	91—103
	V — Trade	24—41	106—133
	VI — Public force	42—44	139—143
C — Public administration and liberal arts	VII — Public administration	45	144—147
	VIII — Professions and liberal arts	46—50	148—160
	IX — Persons living on their income	51	161
	X — Domestic service	52	162—163
D — Miscellaneous	XI — Insufficiently defined occupations	53	164—167
	XII — Unproductive	54—55	168—169

it consists of 4 main Classes, 12 Sub-classes, 55 Orders and 169 groups. In 1901, there were 8 main Classes, 24 Orders, 79 Sub-orders and 520 Groups. The scheme of classification has now been made much simpler. In classifying the detailed occupations, the following principles have been adopted — (1) Where a person both makes and sells, he is classed as a 'maker'. (2) Industrial and trading occupations are divided into two main categories, (a) those in which the occupation is classified according to the material worked in, and (b) those where it is classified according to the utility it serves. As a general rule, the former category is reserved for the manufacture or sale of articles the use of which is not finally determined, though it sometimes includes articles for which there is no appropriate head in the latter category. Again, wherever a man's personal occupation is one involving professional training, for instance, that of a doctor, engineer, surveyor, etc., he is classed under that occupation. Exceptions are made in cases where the work in a further stage of specialization, has become associated with occupations falling under another category. In regard to makers and sellers, the 1901 scheme of occupational record made no distinction, in view of the fact that, from the general lessening of demand, making and selling have come to be united in the same individual or family. In Travancore, however, a separate return was kept in view and carried out as far as possible. The essential feature of the scheme followed at this Census is the complete separation of the maker from the seller.

165 Generally speaking, the objection to any change in the scheme of classification is that it makes it difficult, if not impossible, to institute even a rough comparison with previous Censuses. If such comparisons could not be made, statistics lose half their value and the occupational development of the people fails of ascertainment. The objection, however, applies only where the groups of the previous Census are split up, so that its figures cannot be re-arranged according to the modified scheme. But as, in the new scheme, the nomenclature of the 1901 Census has been mostly retained, the discrepancies arising out of a re-arrangement are not likely to have any great vitiating effect. In view to harmonize the schemes of the two Censuses, a re-grouping of the occupations recorded in 1901 has been made. About 60 groups have had to be thus sub-divided and distributed over other different groups, and several others have had to be combined. The procedure followed in working out the figures is explained in detail in Subsidiary Table VII which, in respect of occupations supporting about one per mille of the population or 3,500 and over, compares the strength at the two Censuses. While every attempt has been made to gauge decennial variations, it is but fair to note that, in several cases, the results arrived at are only approximations.

General Features of the Return

165 If the four broad Classes under which the occupations recorded at the Census have been grouped, are taken up and compared with one another it is seen that Class A dealing with the production of raw materials takes in 56 per cent. of the entire population. Class B (preparation and supply of material substances) comes next in strength with a percentage of 37. The miscellaneous occupations (Class D) which comprise general labour domestic work and unproductive services absorb another 18 per cent., while the remaining 4 per cent. subsist on occupations connected with public administration and liberal arts (Class C). The functional distribution of the population shows that, to the majority agriculture in one form or other constitutes the principal means of support. Of the 56 per cent. engaged in producing raw materials, 54 per cent. are concerned with pasture and agriculture. These are assisted by the general labourers who form 12 per cent. and who, though shown under Class D are largely dependent on work in the fields and gardens. Thus, to 68 per cent. or two-thirds of the population, agrestile pursuits afford the means of subsistence. Of the non-agricultural callings to which the rest (84 per cent.) are devoted, the most important relate to food industries including trade in food stuffs. These maintain 10 per cent. of the population of whom the most

Diagram showing the distribution of the agricultural, industrial, commercial and professional population by Administrative Divisions.

Note.—The base of each rectangle is proportional to the population of each Administrative Division. The height shows the percentage of the population of each Administrative Division which is employed on each class of occupation.

numerous are toddy drawers and sellers, dealers in fish traders in vegetables condiment grain and pulse, rice pounders and huskers. Following the food industries come (1) textiles and dress industries which support 8 per cent., (2) working and dealing in wood, building and furniture materials, 4 per cent., (3) the learned and artistic professions, 8 per cent. and (4) work in metals, one per cent. The public administration including defence to which the bulk of a country's population teaches it self to look up to provide employment to the small proportion of about one per cent.

167 The distribution of the agricultural, industrial, commercial and professional population in each Division is given in Subsidiary Table III and illustrated in the marginal diagram. It is seen therefrom that in every Division agriculture supports the largest number of persons and that the commercial and indus

trial population is very small Compared with one another, the Administrative Divisions show that agricultural occupations are most largely represented in Devikulam and Kottayam, the ratios on their population being 74 and 56 per cent respectively, that the industrial element is strongest in Padmanabhapuram and Kottayam—27 and 18 per cent respectively, and that the professional and commercial are most numerous in Trivandrum and Padmanabhapuram, the proportions being respectively 13 and 4 per cent for the former Division, and 13 and 3 per cent for the latter In respect of all the Classes, except the industrial, Quilon takes the third or middle place As between the two Natural Divisions, the Eastern exhibits a much higher percentage of persons dependent on agriculture—64 per cent, as against 45 per cent in the Western Division, which comes in for a bigger share in regard to the other three Classes The disproportion is specially evident with reference to industry and commerce, the littoral regions being twice as strong as the interior tracts In a thousand of the population, there are, in the former, 216 persons who are maintained by industries and 127 by commerce, while the corresponding ratios for the Eastern Division stand, as may be expected, at 112 and 62 respectively

188 If the occupations returned are grouped and viewed from the stand-point of the Indian village, they reveal features characteristic of its organization The marginal statement gives the proportion per 10,000 of the people, who follow the more common village occupations They have been grouped on a rather wide basis For instance,

Number	OCCUPATION	NUMBER PER 10,000 OF TOTAL POPULATION
1	Agriculturists including growers of special products [1, 2, 5, 120]	4,638
2	Labourers, agricultural and general [4, 6, 167]	1,902
3	Toddy drawers and distillers [65, 114]	449
4	Grocers and confectioners [62, 63, 117, 119]	189
5	Grain parchers, rice pounders, etc [56, 68]	74
6	Stock owners, milkmen and herdsmen [9, 10, 12, 61, 118, 123]	39
7	Oil pressers [58]	56
8	Cotton workers and weavers [22]	102
9	Rope, string, etc, makers [24, 25]	363
10	Carpenters [36, 82]	179
11	Basket makers, etc [37, 110]	120
12	Brass and copper workers and sellers [49, 127]	24
13	Blacksmiths and goldsmiths [41, 89]	147
14	Potters, brick and tile makers [47, 48, 112, 128]	63
15	Fishermen and boatmen [14, 60, 97, 116]	390
16	Tailors [63]	18
17	Barbers [72]	60
18	Washermen [71]	77
19	Masons, thatchers, etc [78, 79]	14
20	Grain dealers and money lenders [105, 121]	105
21	Dealers in piece goods and other textiles including other shop-keepers [103, 135]	153
22	Dealers in hay, fodder, etc [124, 130]	27
23	Priests [148, 150, 151]	97
24	Medical practitioners [154, 155]	30
	Total	9,341

NOTE.—The figures in square brackets refer to Group numbers

medical practitioners include the votaries of both Eastern and Western medicine, priests cover also those of the non-Hindu persuasion and who do not belong to the old village community, the same remark applies to shop-keepers However, it is seen that the basic features have continued undisturbed, nine persons out of every ten pursue or subsist by one or other of the village industries, and the proportions under the several callings appear to follow the primary and secondary requirements of man "A peculiar feature of Indian rural life is the way in which each village is provided with a complete equipment of artisans and menials so that, until the recent introduction of western commodities, such as machine-

made cloth, kerosine oil, umbrellas and the like, it was almost wholly self-supporting and independent" Such self-contained unit is, in fact, the finale of the caste system based on hereditary occupation and characterised by economic and social interdependence As has been aptly observed, each village was "economically, a water-tight compartment, self-contained and independent of the outside world for the necessities of life, but for commodities not obtainable within its own borders, it depended on foreign sources of supply * * Foreign trade, necessarily confined to the few large towns, was limited to superfluities or luxuries,

form 86 per cent. The industrial occupations take up 50 per cent of those engaged in the production and supply of material substances, and trade 40 per cent, the remaining 10 per cent being devoted to transport. Of the 89,085 persons who derive their means of subsistence from some occupation or other relating to the public administration and liberal arts, 21,263 or 54 per cent belong to the 'professional classes. Under the miscellaneous head, 20,629 persons or 77 per cent follow indefinite callings and 4,041 persons or 15 per cent are employed in domestic service. It serves no useful purpose to go into further details. By way of summarising the salient features of the statistics, an abstract is entered on the previous page which gives, for 20 selected occupations, the proportions which they respectively bear to the total town population and compares them with the corresponding ratios for the entire rural area. This abstract gives in one view the conditions of the urban community as a whole and the relative bearings of the chief avocations pursued. It is found that the urban population shares to a great extent the essential characteristics of the rural and that agriculture and all food industries give employment to a large proportion. In appreciating the features that may be taken to mark off the urban from the rural, it has to be remembered that most of the localities taken in as towns owe their recognition, in great part, to the presence in them of administrative institutions. These bring about several occupations supporting a large number. But, even if such pursuits are left out of consideration, a divergence between the urban and rural proportions is noticeable in regard to the industries of luxury, letters, arts and sciences, domestic labour, transport service, etc. And as some of the bigger towns are best suited, by their position, for the location of industrial and other undertakings, the statistics may be taken to reflect the extent to which the facilities afforded are availed of.

190 The review of the main features of the occupation return will be closed with a brief notice of (1) the proportion of actual workers as distinguished from their dependants, and (2) occupations of females.

**Workers and
dependants**

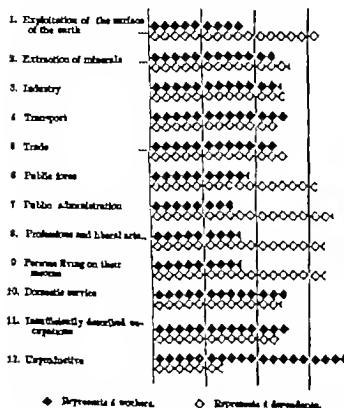

In regard to the first heading, the instructions to the Census agency were to the effect that such persons were to be shown as dependants as did not work or carry on business either personally or by means of servants, or owned no private property. Women and children, working at any occupation that helped to augment the family income, were to be entered as workers. In the case of non-working and non-earning members of a joint family where more than one member was earning and supporting the others, the occupation which the eldest or chief member considered the most important was to be entered as that on which the non-working members were dependent.

From the statistics thus collected, it is seen that 1,421,646 persons or 41 per hundred of the population have been returned as workers, and the rest, 2,007,329 or 59 per cent, as depending on them. The proportions of the main Classes are reproduced in the margin. The smallest proportion of workers is naturally found in the forms of employment included in Class C (public administration and liberal arts), while the dependants are relatively fewest in Class D which deals with occupations, such as, domestic

CLASSES.	NUMBER PER CENT	
	Workers	Depen dants
A — Production of raw materials	86	64
B — Preparation and supply of material substances	40	51
C — Public administration and liberal arts	33	67
D — Miscellaneous	52	48

service, unskilled labour etc. The marginal diagram illustrates in detail

Ratio of workers and dependants in Sub-classes.

the ratios of workers and dependants in each of the 12 Sub-classes into which the four main Classes are divided. The actual workers are in a majority in unproductive service (73 per cent.) in transport and insufficiently described occupations (62 per cent. each) and in domestic service (51 per cent.) Subsidiary Table I gives further details in regard to the 55 Orders. It will be observed therefrom that the dependants are fewest in Orders 54 and 55—inmates of jails and hospitals, beggars, etc. where they number 28 and 20 respectively in a total of one hundred each. Next comes textiles (Order 6) with a percentage of 34

dependants. Trade in wood and trade in fuel (Orders 28 and 38) return ratios of between 33 and 80 dependants. Under pasture and agriculture (Order 1) there are to every 100 actual workers, 181 who depend upon them for sustenance. The dependants are most numerous in Order 47—law Order 17—production and transmission of physical forces, and in Order 34—banks and other establishments of credit, the percentages on the total supported by each being respectively 77 74 and 71

It has already been noted that the actual workers in all the occupations together aggregate 41 per cent of the entire population of the State Subsidiary Table I distributes them among the different Sub-classes and Orders. From the details entered therein, it is observed that 20 per cent or nearly one-half of the total number of workers are engaged in the exploitation of the surface of the earth (Sub-class 1) which is almost co-extensive with pasture and agriculture 8 per cent. of the population work at industrial occupations of which 3 per cent. are devoted to textiles and 2 per cent. to food industries. Of the remaining 13 per

For 100 workers	males number	64
	females do.	81
No. of females per 1,000 males	males number	673
	females do	31
No. of females per 1,000 males	males number	619
	females do	63
No. of dependants per 1,000 workers	males number	85
	females do	44
No. of dependants per 1,000 workers	males number	74
	females do	73
No. of dependants per 1,000 workers		2,718

cent. of actual workers, 8 per cent. are general labourers who have returned no definite occupations, and 4 per cent. are traders. Of the latter over one-half deal in food stuffs.

The marginal abstract exhibits the relation between occupation and sex—between workers and dependants as among themselves as well as with reference to each sex separately

Of the actual workers, over two-thirds are males while among the dependants, nearly two-thirds are of the weaker sex. Again, of the total males

over one-half are workers in some occupation or other, while, of the total females, the workers count only a little over one-fourth. The proportion of females to males is, among dependants, nearly four times as large as among workers.

191 These facts illustrate the extent to which, generally speaking, females actively employ themselves in earning the means of subsistence. Subsidiary Table VI details the occupations of females, and the marginal statement reproduces those in which they are in a vast majority as compared with males. In respect of occupations in which the actual workers alone number over 10,000, the total strength is entered within brackets.

In four other occupations, the females number over 10,000, though, when compared with males, they are either on a par or in a minority. They are (1) unspecified labour with a total of 114,576 female workers, (2) field labour—59,405, (3) ordinary cultivation—55,260 and (4) vegetable, fruit, betel, etc., growing—12,373. The proportions in which the females stand to 100 males working at these occupations are respectively 110, 80, 16 and 20. It will be seen from the abstract that most of the ordinary and simple avocations are mono-

Group number	OCCUPATION	No of FEMALE WORKERS PER 100 MALES
56	Rice pounders and flour grinders (14,050)	2,750
62	Makers of molasses and sugar	2,742
61	Butter, cheese and ghee makers	2,475
58	Grain parchers	480
25	Cocconut and other fibres Workers in	428
24	Rope and string makers (57,955)	243
119	Sellers of sweetmeats, molasses, etc	197
118	Sellers of milk, ghee, etc	194
116	Fish dealers (19,748)	183
110	Traders in wood	178
21	Cotton ginning and cleaning	166
87	Basket makers (12,493)	158
8	Firewood collectors and charcoal burners	155
64	Brewers and distillers	155

polized by women. The occupations in which they are slightly more numerous than the other sex are cooking and indoor service, washing and cleaning, trade in pottery, dealing in firewood and charcoal, and that standing out on a nation's economic morale, *viz*, mendicancy. The ratio of females ranges between two-thirds and four-fifths of that of males, among field-labourers, grain and pulse dealers, textile traders, hotel-keepers, liquor vendors. In regard to the occupations of females, it may be remarked that they are usually grouped under three classes—(1) those in which they work independently, such as, rice pounding, flour grinding, domestic service, etc., (2) those in which they act as a kind of complement to their husbands, such as, selling of fruits, vegetables, milk, fish, etc., provided by the latter and (3) those in which the two sexes work together, such as, field labour, basket-weaving, etc.

A word may be added here about the occupations of females in general. It has been observed that "the employment of women may add to the economic efficiency of the community at large, but it does not necessarily conduce to the well-being of the labouring classes. In a certain part of England, it has been stated that the reliance on the additional earnings of the women engaged in glove-making has caused the farm labourers to accept a rate of wages below that which affords the normal human subsistence." * So far as India was concerned, an analysis of the statistics of the 1901 Census did not apparently establish any connection between the material condition of the people and the extent to which women shared in the labours of men. The proportion of female workers differed considerably in different tracts, irrespective of their material condition, nor was the proportion seen to vary with the pressure on the soil. It is explained that local variations are due

* Journal of the Statistical Society, 1903, quoted in the all India Census Report, 1901, page 202

to the state of feeling regarding the seclusion of women. If the order of the social structure and the duties assigned to the sexes in India are to be correctly appreciated, this explanation is clearly convertible in terms of varying economic want, on which social feeling is, in the last sort dependent. The true sphere of woman's work is the family and if she ventures out in search of labour it is because want forces her out much against her grain. When the means of livelihood are assured by the husband, the woman is generally consecrated to the home and such an arrangement, continued for a generation or two, tends to develop what may be called, in the language of modern caste treatises, "sex rigidity." However the tendency is developing for woman to step out and bear with man the toils of out-door life, and prejudice herself in the discharge of the functions so peculiarly her own. But a diminution in the number of females that work at their own means of support, *pari passu* with an advance in their numerical strength should not, wherever it is found, be taken as symptomatic of social unprogressiveness or economic stagnation. It is only indicative of a state of things in which woman could still afford to confine her time and attention to the home, and hold on to her appointed place as the necessary counterpart of man.

Agricultural Occupations

192. The first place in the general scheme of occupations (Table XV A) is assigned to agriculture. Order 1 of Sub-class I in Class A comprises 13 groups, of which the first six deal with the agricultural population. The classification adopted is reproduced in the margin. The first two groups have been further sub-divided into non-cultivating land holders and tenants and cultivating land holders and tenants. The former correspond to the rent receivers and the latter to the rent payers. The six groups together give a total of 1,892,738 persons, or 63 per cent. of the whole population as being agrarian. This proportion does not exhaust the entire strength. Under the head of labourers unspecified (group 167) 417,725 persons have

Classification	
Order 1	
Agriculture	
(1) Ordinary cultivation	<ul style="list-style-type: none"> 1. Income from land of agricultural land. 2. Ordinary cultivators. 3. Agents, managers, clerks, &c. 4. Farm servants and field labourers.
(2) Growers of special products and stock rearing	<ul style="list-style-type: none"> 5. Tea, coffee, &c. plantations. 6. Fruit, flower, vegetable, hotel, amenity &c., growers.

been entered, who depend mainly on agricultural work for their subsistence. If these are also taken into account, the aggregate number of those who have an interest in land rises to 2,310,463 and constitutes 68 per cent. or two-thirds of the population of the State. The corresponding figure for the 1901 Census was 1,800,018 which formed 63 per cent. of the then total population. The variation during the last decennium gives an increase of 500,235 persons in the agricultural population or a percentage of 91. If the group of unspecified labourers is excluded and the comparison confined to the six groups above referred to the total for 1901 comes to 1,301,87. The present strength yields an addition of 31 per cent. for the last ten years. The divergence between the two variations is due to the decrease under the head of unspecified general labourers, attributable to a fuller recordation of the definite occupations followed.

193. Of the total agricultural population 95,61 persons derive support from rent of agricultural land. Of these 91,300 or 95 per cent. are Land holders and 4,450 tenants under the latter. The rent payers number 1,289,011—land holders 1,163,974 and tenants

124,067, the ratios in a total of one hundred being 90 and 10 respectively. Both rent-receivers and rent-payers together constitute 40 per cent of the total population of the State, the cultivators forming 37 per cent and the non-cultivators 3 per cent. Thus, about one in every three is either a rent-receiver, or rent-payer or is dependent upon either for his means of subsistence. If the two classes are re-grouped into land-holders and tenants, it is seen that the former amounts to 91 per cent of the total and the latter 9 per cent, the actual strength being 1,255,279 and 128,523 respectively. Among the land-holders, the cultivators form 93 per cent and among the tenants, 97 per cent. In 1901, the classification of the occupations dealt with here was a little different. Further, as many as 290,935 land-occupants omitted to specify the nature of their interest in land, and these were shown under a separate group. It was, however, observed in that Report that most of them were probably owners of small holdings which they themselves cultivated. On this supposition, a fairly accurate idea may be gained of the variation in the strength of the landholders and tenants during the last ten years. The figures for the two Censuses when worked out show that, in a thousand of the population, there are now 366 landholders against 340 in 1901, and that in a like number, there are 37 tenants against 31. The variation in the actual strength gives for the last decade a percentage increase of 25 to the former and 40 to the latter.

194 Field labourers and farm servants aggregate 229,809, of whom 58 per cent are actual workers and the rest their dependants. The number returned under this head in 1901 was 154,796. The increase at this Census is thus considerable, but it does not appear to be genuine. Under the group of unspecified labourers, there has been during the last decade a decrease from 458,421 persons to 417,725. Most of these work in the fields or are engaged in market gardening and other agricultural pursuits and earn therefrom the greater part of their income. A more precise return of the occupations of these men has evidently resulted in reducing the strength under the 'indefinite' head and bringing them under the proper category. If the two groups of workers are taken together, the variation for the last decennium comes to an addition of 5 per hundred. The increase, however, is small and perhaps reflects, more or less, the general dearth of labour which one not unoften hears of. An examination of the fluctuations for successive decades may help in ascertaining how far figures lend support to this contention. But it is not possible to carry the comparison further back than 1901, as it is difficult to accept the figure for the Census preceding which put down nearly half the then population of the State as agricultural labourers and crop-watchers.

195 The agricultural population comprises (1) those who are solely agriculturists and are not engaged in any other occupations, (2) those who follow agriculture as the main occupation and have, besides, some non-agricultural calling as a secondary means of livelihood and (3) those whose principal means of subsistence is a non-agricultural occupation and who resort to agriculture as a supplementary source of income. The statistics dealt with in the preceding paras covered the first two heads as far as agricultural pursuits formed the chief support in life. There remain for notice the subsidiary occupations of agriculturists and the principal employments of those who are only partially dependent on land. Particulars in regard to the former are recorded in Table XV B. Table XV A gives the chief occupations of those who are only agriculturists in the second degree. The information contained in

these Tables is exhibited in Subsidiary Tables IV and V and it has to be noted that the figures all refer to actual workers and do not include dependants. Again, the term agriculture means here ordinary cultivation and includes rent receivers (group 1) rent payers (group 3) and farm servants and field labourers (group 4). The unspecified labourers (group 167) who though almost wholly landless, depend upon agriculture for their support, as well as the growers of special products, such as, vegetables, betel arecanut, etc. (group 6) have not been taken into account.

190. In all 7,005 persons, or 81 per 10,000 of the total number of workers who have stated some non-agricultural pursuit as their principal occupation have returned themselves as partially agriculturists. The corresponding figures for the 1901 Census were 6,313 and 70 respectively. The strength of partial agriculturists has thus increased during the last decade by 793 or 18 per cent. The marginal statement gives the actual and relative distribution among the four main Classes: 93 per cent.

CLASS	STRENGTH	RATIO PER 10,000 WORKERS
A. Production of raw materials	297	4
B. Preparation and supply of material substances	1,351	19
C. Public administration and liberal arts	1,785	25
D. Miscellaneous	601	8
Total	7,005	93

of the persons who have recorded agriculture as an auxiliary occupation being found in Class B but with reference to the total workers in that Class, the proportion amounts to only one in a hundred. Public administration and liberal arts, which take in 25 per cent of the partial agriculturists, return the highest ratio viz 858 per 10,000 of the actual workers therein. In Class D

which contains another 9 per cent of the total there are in every 10,000 workers, 28 who partially depend on agriculture. If the Sub-classes are compared with one another it is seen that Public force (VI) shows the highest proportion 194 per mille of those who have named agriculture as a subsidiary means of subsistence. In the Army one in every seven, and in the Police one in every eight, partly live by cultivation. Next to sub-class VI comes Sub-class VII (public administration) where one in every 25 workers is in part dependent upon agricultural occupations. Among village officials there is one in every 8 and among the other public servants, one in every 50. The actual number of partial agriculturists is largest in Sub-class III (Industry)—2,918 of whom 1,363 are toddy drawers. The ratio to the total actual workers in that Sub-class stands only at one per cent. This average however is exceeded in three of the Orders included in the Sub-class namely Order 21 (food industries) Order 13 (industries of dress) and Order 9 (metals) the ratios per mille of workers being 22, 12 and 11 respectively. Of those engaged in domestic service (Order 5) 5 per thousand are partially agriculturists. Of the workers in textiles (Order 6) the proportion is only 2 per mille.

191. The number of persons who have returned agriculture as their main calling is 560,357. Of the 3,508 or 6 per cent. who have also stated some other occupation. These subsidiary occupations are shown as already stated under the heads of rent-receivers, rent payers and field labourers. 11 per mille of the first named are rent payers, 16 money lenders or grain dealers, 14 traders and artisans. Of the rent payers 12 per 1,000 are agricultural labourers, 7 are traders and 6 again, money lenders or grain dealers. Lastly among the field labourers 6 per mille are rent payers, 4 weavers and 2 milk

men (keepers of cows) The figures may also be considered in another way, that is, the strength of each subsidiary occupation may be compared with the total for all the subsidiary occupations together Thus viewed, it is seen that, among such of the rent-receivers as have retained some secondary employment, about one in 3 is a rent-payer, one in 7 a money lender, one in 20 an artisan or a clerk (not Government) and about one in 25 is a schoolmaster Of the rent-payers, one in 6 is an agricultural labourer, one in 11 is a general labourer or trader, one in 28 a blacksmith or carpenter, one in 30 a milkman or keeper of cows, one in 44 a fisherman or boatman, one in 55 a weaver and one in 73 a potter Among agricultural labourers, there is one rent-payer in every 4, a weaver in every 9 and a milkman in every 19 About one in 41 is a leather worker, one in 53 a mill-hand, one in 68 a potter and one in 78 is a trader

Non-Agricultural Occupations

Preliminary 198 In para 186 *supra*, a brief review was made of the main Classes of occupations and of the more important Sub-classes Certain general features relating to village industries, workers and dependants, etc., were also noted The agricultural callings which afford sustenance to a vast majority of the population were next taken up and examined These in a way exhaust the subject But it has to be remembered that, under modern conditions, the chief interest in the return of occupations centres round the non-agricultural employments New forces have been at work and the old order has begun to change The transition, though exceedingly slow and not easily recognizable for accurate measurement, marks withal the dawn of another stage in man's activities It therefore deserves to be recorded, especially in view of the fact that, in India generally, occupation forms the basal feature in social polity The statistics, therefore, will be treated in some detail In this treatment, the classification scheme as per the General Table XV A will be adhered to and the occupations dealt with *scrutinim* Unless otherwise stated, the figures discussed here and elsewhere refer to the total supported—actual workers and their dependants

199 The first Class in the scheme of occupations is also the most strongly represented In a thousand of the entire population, as many as 556 belong to Class A, and of these, 199 are workers The total actual strength amounts to 1,907,199, and is almost equally divided between the two Natural Divisions With reference to the population in each Division, the ratio of this Class stands at 49 per hundred in the Western tracts, as against 65 in the Eastern The marginal statement comprises the distribution among the Administrative Divisions

DIVISION	PERCENTAGE ON POPULATION IN	
	Class	Division
1 Palaniabhapuram	11	49
2 Trivandrum	14	40
3 Quilon	83	58
4 Kottayam *	87	50

*Here and in other parts of this section, Kottayam includes Devikulam

In attempting a comparison with the 1901 Census, it may be observed that dealers who were grouped with workers have now been transferred to Class B Again, occupations which came under the latter in 1901 have now been brought

under Class A But this does not appear to vitiate the results The main head of agriculture continues undisturbed, and the re-arrangement, by separation and transfer, is confined to a fractional part of the population By thus throwing together the figures of the corresponding groups for 1901, it is seen that ten years

ago, the production of raw materials supported a population of 1 459 611. The increase at this Census is 447 688 and works out a percentage of 30.

Class A is divided into two Sub-classes, according as raw materials are obtained by working *upon* the surface of the soil (I) or by working *under* the soil (II). The former is sub-divided into two and the latter into three Orders both together comprising 20 groups.

200 Sub-class I maintains 1,000,406 persons or 56 per cent. of the population. The two Orders included hereunder are (1) pasture and agriculture—54 per cent., and (2) fishing and hunting—9 per cent.

Sub-class I.
Exploitation of the
surface of the earth.
(Orders 1 and 2)
Groups 1-16

ORDER 1 *Pasture and Agriculture* — The first four groups of this Order refer to agriculture and have been treated in detail so far as numbers 1, 2, and 4 are concerned. Group 3 deals with the agents, managers, clerks, etc., of landed estates, who number 2,201 against 1,689 in 1901. The reconstitution of the Agricultural Department during the decade has contributed the greater part of the increase. In group 5 are included the growers of special products, such as, tea, rubber, etc. 14 190 persons earn their means of subsistence from the occupations in this group 10 687 being actual workers. In 1901 the group totalled 5 181 persons including those that were then entered under the heading Plantations unspecified. The workers were 5,060 in number. It is thus seen that the total supported have nearly trebled and the supporters have more than doubled. The variation at this Census appears to faithfully reflect the impetus which the industries have received during the last 10 years. The figures of the Industrial Census, which explain the state of these industries may be referred to here. The results are summarised and reproduced in the margin. 40 plantations and factories

(c) Unskilled labourers	2 205	2 353	1 804
Males	1 553	1 810	1 501
Females	741	543	303

are entered in the abstract as having been worked on the date of the Census, with a total strength of 1,008 persons. In 27 of them the number employed varied from 20 to 10 from 20 to 100 in 4 from 100 to 200 in 6 from 200 to 400 and in 2, the totals were over 400. Electric power was used in 4 steam in 1 water in 6 oil in 9 and gas in one. Of the persons employed, 3 491 were males and 1 467 females. The unskilled labourers below the age of 14 numbered 670 of whom 31 were girls. It may be explained that the Industrial Census referred only to the work on a particular date and that the persons shown as subsisting by the industry referred to included only the actual workers. Even then the strength approached the 1901 total in which were included not only the persons who worked the entire year round but also their dependants. Market gardening, (group 6) which in the land of palm plantations and tapoca is largely pursued, afforded a livelihood to 19 (84) persons or one in every 18 of the inhabitants as compared with a total of 135 169 or one in every 22 of the preceding Census. Over three-fifths of the variation stand credited to the dependants.

Forestry (group 7) and 8) support 6 460 persons, or two per mille of the population. These include the officer and other employees of the State Forest

Department, which was strengthened to double the original number in the course of the last decade. The men of the Department now muster 575, and with their dependants 1,734, as against 306 and 885 respectively in 1901. The wood-cutters, firewood collectors, etc., (group S), number 4,732. A reduction is observable under this head, when compared with the corresponding total of 5,263 at the previous Census. The variation, however, is only approximate, as the 1901 figure was inflated by items now spread over different groups (36, 37, 110 and 130) and embracing in their scope other occupations as well.

The raising of farm stock (groups 9—12) is the occupation of 10,196 persons, of whom 8,663 are herdsmen and shepherds. The corresponding groups of the preceding Census covered some allied occupations now shown under groups 118, 123 and 129 of Class B. Even if these are not taken into account, and the return, as it is, compared with the total of 1901, there is an increase of 12 per cent in the number of those dependent upon pasture. But by stock-breeding, 3 per mille of the population alone subsist. The subject calls for some observations, which will be made later on when dealing with the results of the Cattle Census.

ORDER 2 *Fishing and hunting*—66,043 persons are comprised in the two groups (14 and 15) of this Order, of whom all but 65 are engaged in the occupation first named. The most important towns in the State are situated on the coast-line and several of the others border the backwaters and the lakes. The proportion of actual workers in the urban area appears accordingly higher than in any other Order of Class A, being about one in every ten. The dependants number less—103 to 100 workers against 138 in the rural tracts. In 1901, the fishermen and fish curers totalled 51,546, and shows an increase of 28 per cent for the last decade. In view to understand the growth at this Census of the entire population concerned with fish, the related items of curing and purveying should also be taken into account. The curers are now shown separately (group 60), while the dealers have been given a distinct heading at both the Censuses. If these are also taken in, the aggregate strength amounts to 116,770 against a corresponding total of 95,804 in 1901. The variation thus yields for the intervening decennium a percentage addition of 22 for the occupationalists connected with this important article of dietary.

201 Sub-class II is a small one, only 5 per 10,000 of the population subsisting by the occupations connected with mines (Order 3) and salt (Order 5). The former returns 1,295 persons and the latter 438, or together 1,733 persons against 1,613 in 1901. According to the Industrial Census, there were three plumbago mines at work under European ownership and management. In two of these, mechanical power was used. The total number of persons employed was 1,028, of whom 702 were unskilled labourers—477 males and 225 females. 33 of the males and 36 of the other sex were under 14 years of age. Of the 284 skilled workmen, 5 were Anglo-Indians and the rest Indians and of the 42 men engaged in direction, supervision and clerical work, 5 were Europeans and 5 Anglo-Indians.

202 The preparation of articles out of raw materials and their supply at the places where they may be required are dealt with in this Class. It therefore comes second in the scheme and retains that place in respect of numerical superiority as well. In all, 928,685 persons are maintained by this Class, of whom 455,656 or 49 per cent are actual workers. On the population of the State, the total supported amounts to 27 per cent, the workers forming 13 per cent. In a hundred of the latter, 94

Sub-class II
Extraction of
minerals
(Orders 3—5
Groups 16—20)

Class B
Preparation and sup-
ply of material sub-
stances

are found in the country and 9 in towns. The dependants stand to the supporters in the ratio of 101 to 100 in the rural parts while in the urban areas, the proportion rises to 123

DIVISION	PERCENTAGE OF POPULATION IN	
	Class B.	Division.
1. Palmonakkhaperam	18	41
2. Tiruvanduram	18	29
3. Qonlon	21	43
4. Kottayam	21	25

Unlike in Class A the two Natural Divisions differ from one another in regard to the number of inhabitants supported. Of the total the littoral and deltaic regions contain 73 per cent. which works out to 34 per cent. on the population of the Division as against

27 per cent. and 17 per cent. respectively in the sub-montane and mountainous tracts. Similar proportions for the Administrative Divisions, which are entered in the margin show that the order they preserve in regard to their respective ratios on the total of Class B stands generally reversed, when the strength in each is compared with the aggregate population.

The increase in the number of persons supported by this Class during the last decade is only 5 per cent. In other words, for every six persons added to those engaged in the production of raw materials, there is barely one more in the work of preparing and distributing them for use. If some of the Sub-classes show large accessions, it is due partly to greater definiteness in the return of occupations and partly to natural causes having had unfettered play among such groups as are not subject to external competition.

In the detailed consideration of Class B it has to be remembered that the conversion of the raw materials into prepared articles and the rendering them available for further use fall under three successive kinds of employment—(1) arts and processes of manufacture by which the raw materials are worked up (2) transport by which the resulting products are taken to the places where they may be needed, and (3) trade by which they are exchanged into the hands of the persons requiring them. To represent these three processes the Class is divided into three sub-classes—Industries Transport and Trade

203 Industrial occupations are grouped under two broad categories, according to the substances used or the needs satisfied. In the former case the materials utilized lend their names to the Industries such as wood metal etc. while in the latter they are denoted by the uses to which the finished articles are applied, such as industries of food of dress etc. Thus arranged Sub-class III contains 14 headings or Orders—6 under the first and 8 under the second. The proportions which the principal Orders bear to the total of the Sub-class are shown in the margin. The statement is instructive as showing that the industrial occupations pursued in the country are almost limited to the satisfaction of simple need. To meet the primary want of man very little work has to be done on the materials procured by agriculture and in the work of grain preparation grinding and binning 4 per cent. of the total of the Sub-class are employed. Evidently most of those who obtain the cereal themselves prepare them or engage their household servants for the purpose. Of the remaining persons who are supported by other food industries almost the whole are daily labourers. In regard to the supply of the next want the

Sub-class III	Industrial occupations	Orders 6 to 13	Proportions
1	Food	6 to 13	100
2	Dress	14 to 17	10
3	Shelter	18 to 21	10
4	Transport	22 to 25	10
5	Trade	26 to 29	10
6	Arts	30 to 33	10
7	Manufacture	34 to 37	10
8	Services	38 to 41	10
9	Education	42 to 45	10
10	Religion	46 to 49	10
11	Amusement	50 to 53	10
12	Health	54 to 57	10
13	Other	58 to 61	10

number at work is equally low. Only 6 per cent subsist by cotton, the remaining 21 per cent being connected with sacking and fibre industries. Clothing for wear is largely obtained from outside. Work in wood takes in 16 per cent, but, of these, a third relates to basket-making and allied occupations, while the remaining two-thirds are made up of sawyers and carpenters. Ceramics referred to in the abstract has nothing to do with glass or porcelain, but is concerned only with earthen pots and pitchers, bricks and tiles. The chemical products shown therein are the vegetable oils for every-day use. Again, blacksmiths and copper-smiths take up the entire strength shown under the Order of metals, while goldsmiths constitute 86 per cent of those who earn their means of subsistence by the 'Industries of luxury'. If the occupations connected with neatness of dress and the toilet show a ratio of 10 per 100 of the Sub-class, it is because 5 of them are barbers and 4 washermen. Thus, it is seen that the occupations on which over 96 per cent of those contained in the Sub-class depend, are but simple processes by which raw materials are merely passed on for consumption, or for use in other industries. Further than this, they do not go. The more complex ones connected with furniture, building, construction of means of transport, production and transmission of physical forces are nowhere in the statement. In fact, the observations made in 1901 admit of being repeated, as summing up, in its essential features, the industrial aspect of the last decade. "Industrialism conducted on modern scientific lines is in this country in its veriest infancy. At the same time, the old indigenous industries are fast giving way, if they have not already done so, before the aggressive energy of foreign competition. Native capital and intelligence are yet to appear on the scene to resuscitate them or to inaugurate fresh ones for which the resources of the country offer a fertile field. If we except the occupations followed to meet the requirements of an unadvanced cultivating population, the industries pursued consist mostly in preparing raw materials to be worked up by foreign hands and re-imported as finished products. Articles intended to satisfy the demands of taste, fashion or even necessity in several cases, are indented for on other countries. The classes of people, therefore, who concern themselves with local industries are generally small producers."* A decade, probably, is too short a period for healthy economic tendencies, if any, to produce perceptible effect. Here, attention may be directed to the results of the Industrial Census, dealt with in para 217 *infra*. The industries relate to all the Orders entered in the statement given above. Several of them are attempts at supplying wants that are already being met by the occupational castes concerned, and the statistics show that these undertakings, such as they are, have played little part in influencing the functional distribution of the people.

ORDER 6 Textiles.—Four of the 11 groups in this Order have no entries against them and 4 others together are not even 1,000 strong. Of the remaining groups, sacking and net making, fibre matting, etc (groups 24 and 25) support 124,377 persons, as against a total of 104,827 in 1901. The variation gives for the intervening decade an increase of 19 per cent in the number of the people concerned. It is noteworthy that dependants are comparatively few in these occupations and female workers most numerous. The actual workers form 73 per cent of the total supported by the two groups—males 20 per cent and females 53 per cent. The ratio of females on the total workers amounts to 72 per cent, their actual strength being 65,268. Cotton ginning, spinning and weaving, etc (groups 21 and 22) afford the means of subsistence to 35,597 persons or to one in every 96 of the population, as against one in every 103 in 1901.

ORDERS 8—11 —Workers in wood (Order 8) aggregate 93,018 persons of whom however more than one-half are dependants. On the population of the State the total supported comes to 27 per mille. Sawyers and carpenters number 61,005 and the remaining 32,013 persons manage to earn a livelihood from basket making and other cognate industries of woody material. 85,391 persons (one per cent. of the population) are dependent on work in the base metals (Order 9). The blacksmiths are the most numerous (23,289) and with 6,456 persons who work in copper and brass, the Order is almost exhausted. Ceramics (Order 10) supports 14,234 persons, as against 11,358 in 1901. There are 6,206 brick and tile makers and 8,023 potters, who meet the small requirements of their neighbourhood. Of the 20,003 persons who are returned as living by the manufacture of chemical products (Order 11) 19,223 are pressers of vegetable oil.

ORDER 12. *Food industries.*—The avocations classed under this Order refer to the preparation of vegetable and animal food and drink. 168,407 persons (one in every 20) are engaged in these industries and of these as many as 133,703 devote themselves to the drawing of toddy. In 1901 the strength of the latter was 123,080, the variation for the decade being an addition of 9 per cent. Rice pounders and flour grinders have advanced from 21,257 to 25,173 or by 18 per cent. After these, a long way off come the makers of molasses numbering 4,097. There are 1,610 butter and cheese preparers, 870 butchers and 771 fish curers.

ORDERS 13—16.—Order 13 deals with the accessory callings pertaining to neatness of dress and the toilet. In all 60,888 males and females or 2 per cent. of the population subsist by these avocations. With 27,280 barbers and 26,556 washermen, the Order gets almost filled up and with 6,150 tailors put in it has little space left for hats, boots and canes. The industries of luxury (Order 16) give employment only to 25,714 persons or to one in every 133 of the population. The workers in metals and precious stones amount to 23,011 along with whom may be added 1,179 makers of bangles, rosaries, etc. The occupations appertaining to literature and the arts and sciences come under this Order and are chiefly represented by newspaper editing which supports 95 persons, as compared with 64 in 1901. Persons engaged in the polygraphic industries, under which are included book binding book-stitching etc., have increased from 1,187 to 2,226 at this Census.

204 This Sub-class is divided into Orders according as the transport is by water road or rail. With these are also grouped the Postal and

B. & C. Class IV
Transport.
(Orders 10—12, Groups
94—108)

Telegraphic services. The four Orders together contain 54,942 persons in all or 16 per mille of the population, as against 32,035 and 11 respectively in 1901. The variation at this Census thus yields

an actual increase of 22,907 and a percentage addition of 67. This large accession under Transport is contributed partly by the road canal and rail way labourers who have nearly doubled their strength and now number 10,000. The maintenance of canals and rivers gives employment to 6,403 workmen, and the construction of roads and bridges, to 4,019. Having returned the specific occupations from which they derive their principal means of subsistence they have at this Census, separated themselves from among unspecified labourers whose number as already stated, has now perceptibly thinned. The effect of this greater definiteness in the return of occupations is forcibly illustrated in regard to porters (group 10²). In 1901 none was returned to this group while now as many as 13,571 have entered it. The coolies of the Reddi and other castes who are taking to this business

largely in towns and other trading centres, are certainly worthy of being distinguished from the unspecified multitude

'Water,' the first of the Orders in the Sub-class, absorbs 23,895 persons and finds its chief strength in the boat-owners and boat-propellers who total 16,852 or 70 per cent Road (Order 21) engages 25,838 persons, of whom 7,583 are cart-owners and drivers With an addition of 5 per cent during the decade, they have advanced but slowly, when compared with the boat-men under 'Water' who have added 14 to the hundred Rail (Order 22) takes in the smallest number from the Sub-class, 929 The last Order refers to the State Anchal, British Post and Telegraph Departments These together carry 4,280 persons all told, against 2,310 in 1901 The State Service contains 3,367 persons, double the total of the previous Census On Post and Telegraph, depend 913 persons—142 more than in 1901

It was stated in the Introduction that a special Census was taken of the		employés of the Railway, Post, Telegraph and Irrigation Departments, engaged on the 10th March 1911 The returns are embodied in Subsidiary Table X and epitomised in the margin. Of the total shown, the number in regular employ was only 2,638, the remainder consisting of contractors and coolies—66 on the

205. This Sub-class is the complement of Sub-class III which dealt with manufactures "Science has need of distinguishing between manufacturers and dealers They are different from every point of view, as in the nature of their occupations, the influence which they may have upon health, the kind of training which they require, their very manner of thinking and acting are entirely different, their interests are often antagonistic," although the last mentioned feature is the reverse of what it should be in an *organized* society At the Census of 1901, the dealer and the manufacturer were shown together in most occupations, now, they have been separated The Orders under which the sellers are shown follow generally the Orders that dealt with manufacturers and should enable comparison possible But as, in several of the handicrafts and manufactures, the maker is also the seller, the figures for the latter cannot be taken as representing the whole strength This fact has to be specially borne in mind in interpreting the variation in the figures

ORDERS 24—31 —The first two Orders deal with bankers, money lenders and brokers, who number 10,273 against 9,122 in 1901 The ratio on the total population, however, is the same at either Census—3 per mille Orders 26—31 refer to trade in the articles contained in Orders 6—11 The dealers in piece-goods, cotton, silk, etc (Order 26) aggregate 45,221, as against 38,106 at the preceding Census, and give a percentage increase of 19 for the decade In a thousand of the population, trade in textiles takes up 13 Order 28 (trade in wood) supports 9,031 persons (3 per mille) This includes not only dealers in timber and bamboos who were shown separately in 1901, but also the sellers of baskets, leaf plates, etc, who were combined with the makers If all but 10 per cent be taken as workers, the total for the trade in wood works out to 3,634 for the preceding Census The present increase is thus considerable, and though the variation recorded is only approximate, it gives a very fair idea of the efforts that are being made to make the timber of the Travancore forests easily available to the public and of the extent to which they

have stimulated the dealers. The remaining Orders are very poor in strength. 538 persons trade in skins, leather etc. (Order 27) 78 in metals and machinery (Order 20) 2,259 in pottery (Order 30) and 131 in chemical products (Order 31)

ORDERS 32 and 33 —The first (hotels, cafés etc.) shows the large strength of 23 443 (7 per mille) as against a total of 29,385 in 1901. The Order is made up of 20,318 vendors of liquors and 3,225 owners and managers of hotels and their employes, the corresponding figures for the previous Census being respectively 26 403 and 2,863. The decrease among the sellers of toddy and country spirits is attributable to the stricter regulation of liquor trade under the Excise system, which was introduced in the last decennium. Trade in other food-stuffs (Order 33) is the occupation of as many as 168,703 persons, or of one in every 20 of the people. The strength of this Order has increased by 9 per cent. during the last decade. The most numerous of the groups in this Order are the fish dealers who have increased from 44,258 in 1901 to 50,031 at this Census, and the sellers of betel, arecanut vegetables, etc., who number 32,783 as against 29 017 at the preceding enumeration. 37 448 persons are grocers and general condiment dealers and 26,528 deal in grain and pulses. The purveying of tobacco opium and ganja supports 9 717 persons.

ORDERS 34—41 —Of these, the more important need alone be mentioned. 5 004 persons get their means of subsistence by trafficking in building materials (Order 36) 4,093 by trade in fuel (Order 38) and 3,281 by dealing in furniture (Order 35). The number maintained by the fuel trade has advanced nearly ten times during the last decade. The last of the Orders (No. 41) in this Sub-class refers to trade of other sorts and includes shop-keepers otherwise unspecified, itinerant traders, acrobats, conjurers, etc. Of the 10,835 persons shown in this medley of miscellaneous occupations, as many as 7 800 belong to the first mentioned group. In 1901 the unspecified shop-keepers aggregated 64,853 or about nine times the present strength. The vast decline at this Census is another indication of the success in the attempt of the enumerating agencies to secure definiteness in the occupation record.

200 The avocations included under the third Class (C) constitute the protective foundation for the occupations noticed under Classes A and B. "To keep good order and guard the welfare of the preceding occupations every country has an army and a police force (VI) and a public administration (VII). The liberal professions (VIII) and persons living upon their income (IX) naturally follow the occupations just reviewed." The persons who derive their means of subsistence by pursuing these callings are comparatively few. All told, they number 145 428 or 43 per mille of the aggregate population. A re-arrangement of the eight classes of 1901 into four gives to Class (C) a strength of 121 104 persons or 41 per thousand for that Census. The variation in the last decennium represents an increase of 20 per cent. The needs of law and order of public administration and local government are met by the workers grouped under it, to which also belong the ministers of religion and of medicine those engaged in the noble occupation of education and those who cultivate the arts and sciences. The earning members, however form but a third of the total proportion or 14 per mille. Each earner supports two dependants a responsibility heavier than is borne by the members of any of the other Classes. The urban areas absorb the largest percentage of workers from this Class the ratio amounting to a fourth of the total. To every ten of these are attached 23 dependants, as against 10 in the rural tracts.

As between the Natural Divisions, it is seen that, in a total of one hundred, there are 67 in the Western Division and 33 in the Eastern. On the population of each Division, the total of Class B within it works out to 5 per cent in the former against 3 per cent in the latter. The Administrative Divisions show varying proportions which are given in the marginal statement.

Division	PROPORTION ON POPULATION IN	
	Class C Division	
Pudmanabhapuram	13	4
Trivandrum	28	7
Quilon	12	1
Kottayam	27	3

207 In all, 9,289 persons or 27 per 10,000 find a livelihood in connection with the army and the police. The former supports 5,886 persons, with 1,818 working members. The Occupation Table distinguishes between the Nāyū Brigade, which is the army of His Highness the Maha Rajah, from the Resident's Escort which is a portion of the British Indian force. 5,771 persons are connected with the former and 115 with the latter. The corresponding figures for the 1901 Census were 1,916 and 78 respectively. According to the State Administration Report for 1910-11, the effective strength of the State Brigade stood at 1,474.

Police work maintains 3,403 persons against 3,369 in 1901. The latter figure is only approximate, as, at that Census, village servants and watchmen were shown together. A rough proportion is, therefore, now taken for the purpose of comparison. Further, the 1901 figure relates only to the lower ranks of the force and then dependants.

208 The actual strength of this Sub-class is 32,695, which gives 95 persons per 10,000 of the population. The dependants are more than twice the actual workers—69 and 31 respectively in every one hundred. Since 1901, the Sub-class shows a decrease of 17 per cent. As in the case of the public force, a distinction has been made between the service of His Highness the Maha Rajah's Government and those of the British Indian Government and other Native States. The service of this State supports 26,155 in all, excluding municipal and village service. It has to be noted that the employes of the Government in special branches such as education, engineering, etc., which do not form part of the administration proper and may be conducted, partly or wholly, by non-government agencies on their initiative and direction, are not included in this Order. 254 persons are in the municipal and local services, while village officials and servants, with their dependants, number 6,003. The number of persons dependent on the service of British India was 187, and on that of other Indian States, 84.

209 The learned and artistic professions included in this Sub-class are Religion (Order 46), Law (47), Medicine (48), Instruction (49) and Letters, arts and sciences (50). 97,729 persons are supported by all these Orders together against 69,360 in 1901, giving, for the intervening decade, an increase of 40 per cent.

The strongest of the Orders is the first—Religion—in which the number maintained stands at 33,714, or about one per cent of the population. Next comes 'Instruction' with a strength of 23,365, or 8 per mille, and next, 'Letters, arts and sciences' with 18,896 persons, or 5 per thousand. On 'Medicine' are dependent 10,209 persons, and on 'Law' 8,545. The intercensal variations noted in the margin show that 'Instruction' and 'Law' have advanced most rapidly.

ORDER	VARIATION PER CENT DURING 1901—11	
46 Religion	+	24
47 Law	+	61
48 Medicine	+	23
49 Instruction	+	93
50 Letters, arts, &c.	+	23

210 This Sub-class consisting of one Order and one group deals with proprietors, other than of agricultural land, pensioners and scholarship holders. These total 5 715 against 3,516 in 1901 which give an increase of 63 per cent in the number of persons living on their own income. Of these the majority are pensioners maintained by the State for services rendered either by themselves or by members of their family

Sub-class IX.
Persons living on
their income
Order 81, Group 161

211 This is the fourth and last main heading in the classification of occupations, a heading reserved for domestic labour insufficiently described occupations and unproductive services.

The strength of this Miscellaneous class aggregates 447,063 persons, of whom 234,038 are actual workers, the proportions on the total population being 18 and 7 per cent. respectively. The urban and rural areas divide the wage-earners in the ratio of 7 to 93 in a hundred. In relation to dependants, the supporters are more numerous than in any other Class—53 per cent. against 48. In towns, there is one drone to every two workers, while in the country the two groups are almost equal

DIVISION	PERCENTAGE OF POPULATION IN	
	Class D, Division	
Eastern	18	7
Western	41	18
Central	26	13

As usual the Western Natural Division comes in for a large share of the total, 54 per cent against 46 per cent in the Eastern Division. But in relation to the population in either division the sea board and deltaic regions show a lesser percentage—12 against 16 in the interior tracts.

The occupations included in this Class took up in 1901 as many as 483,674 persons. There is thus a decrease at this Census of 36,211 persons or 8 per cent. With reference to the total population at the two Censuses, the decline is from 16 per cent. in 1901 to 13 per cent. in 1911. This decrease however is confined to those who have not accurately described their occupations, and is hence not unsatisfactory.

212. This sub-class consists of all those who are supported by domestic service. The total strength—15 205—represents an advance of 36 per cent over the corresponding figure of 1901. The actual workers number two per mille of the population or in other words, one in every 500 people in the State engages himself in some form or other of domestic service. Of the two groups included in this Sub-class, cooks and other indoor servants have increased from 10 114 in 1901 to 13 663 or by 34 per cent. The advance in the other group consisting of groomers and private coachmen is even more noticeable being as much as 40 per cent—1,512 against 1,081 at the preceding Census.

Sub-class X.
Domestic service.
Order 82,
Groups 162 and 163

13 All those persons who have described themselves as clerks, accountants, contractors, labourers etc., without specifying the nature of the work or the name of the office or establishment in which they are employed, have been brought under this sub-class. These aggregate 1 178 9 persons as against a total of 460,691 returned at the 1901 Census, and yield a percentage decrease of 9—a pleasing feature already noticed. The actual decrease is largest in the group of labourers unspecified, who have declined from 4 84 31 in 1901 to 4 17 73 or by as many as 40,658 persons (—9 per cent.) The general labourers are not wholly distinct from those engaged in connection with a culture and the large increase

Sub-class XI

scribed occupations
Order 83 : Groups 164
165 166 and 167

noted under 'Farm servants and field-labourers'—Sub-class I—explains the decrease here. Of the other three groups in this Sub-class, only one shows an increase, namely, that dealing with cashiers, clerks and other employes in unspecified offices and shops. Here, the number has increased from 5,749 to 6,281 at this Census.

214 Persons who support themselves and their dependants by unproductive services include (1) the inmates of jails, asylums and hospitals, and (2) beggars, vagrants, *et cetera*. The former group consists of 1,740 persons, as against 1,101, ten years previous. But if the dependants are excluded and only those who are actually in the institutions are taken and compared, it is seen that the increase at this Census is only 202. The number of beggars and vagrants comes to 5,879 or one per mille. Though the strength of this group has grown by 1,198 persons or 25 per cent since 1901, the variation in the ratio on the total population is not perceptible.

Occupation by Religion and Caste

215 Imperial Table XV D is new to this Census. It gives the distribution, of occupation by religion. Subsidiary Table IX reduces the statistics to proportions and shows (1) the distribution by religion of 10,000 persons following each occupation, and (2) the distribution by occupation of 10,000 persons in each religion. Both the Tables refer to the total number supported by each occupation, and do not distinguish the workers from their dependants. The Animists, however, being too small in strength, are excluded from account for the purpose of this notice.

Occupation by religion—The Hindus who form two-thirds of the aggregate population naturally influence the numbers under the different occupations and their distribution does not differ materially from that in the State as a whole. In almost every occupation, they preponderate relatively to the other religionists. If the army as well as the police are exempted from notice, Hindus are markedly large in the following—(1) food industries, (2) manufacture of salt, (3) work in metals, (4) industries of dress and the toilet, and (5) banks and other establishments of credit. In each of these, the proportion of Hindus stands above 8,000 in a total of 10,000 of all religionists. In respect of occupations connected with (1) fishing and hunting, (2) production and transmission of physical forces and (3) transport by water, the Christians appear to predominate, the proportions varying from 4,000 to 7,000. In most of the other occupations too, their ratio is higher than 2,000 on a ten thousand of the total. In regard to the Muhammadans, it is seen that trade is their special sphere and that in it they number above one thousand. The trade generally relates to clothing, textiles, metals, fuel, *etc*. They also engage themselves in textile industries and in brokerage and export in similar proportions. In law and medicine, they are fewest, being 33 and 87 respectively, as against 2,580 and 2,218 Christians in a total of 10,000.

Religion by occupation—If each religion is viewed separately and the distribution over the different occupations compared, it is found that the employment which attracts the Muhammadans most is agriculture. They also take largely to the textile industries, trade in textiles and in food-stuffs. Under the heads of law, medicine, religion and public administration, the Muhammadans are the least in number. In regard to the Christians, it is seen that, in addition to agriculture, they largely resort to work in wood and also engage themselves in

food industries. In the liberal arts and professions too their ratio is comparatively high. The occupations which take in the Hindus most are agriculture food industries, textiles, public administration, religion and instruction. As the Subsidary Table on which this review is based fully portrays these and other features they are not referred to here in further detail.

216 Considerable interest and importance attaches to the distribution of occupation by caste and race. This aspect may therefore be touched upon. Imperial Table XVI contains the necessary information in regard to 22 selected castes. Subsidary Table VIII embodies the proportional figures. Reference may also be made in dealing with this subject, to Table XV E Parts III and IV which contains particulars of the races and castes of the persons engaged as capitalists, managers, etc. and in view of the tendency that has to be borne in mind, to return and record the traditional or ancestral calling even though the means of subsistence actually resorted to may be different, the figures have to be taken only as a rough index of the features they are intended to delineate. It may also be added that the figures refer only to actual workers.

The most prominent, but by no means unexpected, fact brought out by the return, is the marked extent to which traditional occupations are being gradually departed from by all classes. If any other tendency is noteworthy it is the general scramble for land, the desperate running to the mother's knee. The first sinner—and every occupational law breaker in a settled social organism is as much sinned against as sinning—seems to be the Brahman whose function is to minister to the spiritual wants of the population. In one thousand actual workers in this community only 14 persons are returned as following their ancestral calling. 220 persons have settled down as land holders and tenants, while the remainder is mostly distributed among the learned and artistic professions (191) trade (128) public administration (116) and domestic service (101). It is the demand for the established religious labour that is really thus measured, and if inaccurately inaccuracy will be on the side of excess, as the shortening of supply does not generally follow that of demand except after an appreciable interval. Among the Izhavas and the Marakkans the ratios per 1000 of each are even lower being 110 and 31 respectively. The occupations taken up are cultivation trade and industries. On the other side of the list appear the Pulayan the Ampattan and the Veluttuvan who have least deviated from their hereditary callings. Above them come the Kuravan the Vanyan and the Nayar who are in greater or less measure adhering to their respective functions. The occupation of the sorcerer Velan seems almost gone and he is turning to the *dernier resort* of all, agriculture for his means of livelihood. So too the astrologer—Kaniyan—but he appears to have some faith in the pursuit of another industry—edjan umbrella making with which however he has been familiar. It cannot be said how long. The tendencies are also noted of the Cheffi and the Channan to look to cultivation as a means of supplementing his income or rather of investing his savings. The Konkani too contributes his share to swell the cultivating class though trade still appears to attract him. Finally the Chakkala has wandered farther than his occupational brother the Vanyan. In a thousand of the former there are only 30 oil pressers, against 1 among the latter while the Chakkala cultivators number 283 as compared with 60 among the Vanyans.

The statistics in regard to industrial undertakings worked on Western line show that in the 108 factories enumerated at the Indian Census five—

CASTE OR RACE	No of FACTORIES	
	Owned	Managed
Europeans and Anglo-Indians	11	61
Indians	27	42
Christians	7	18
Mohammedans	4	8
Hindus	16	16
1 Brahman	5	5
2 Chettis	1	1
3 Iyer	2	2
4 Kollan	2	2
5 Nayar	2	2
6 Redi	1	1
7 Vellala	3	3

mint, a workshop, a school of arts, a stamp manufactory and a press—are owned and worked by Government. Of the remainder, 61 are managed by Europeans and Anglo-Indians, and 42 by Indians. Of the European factories, 50 belong to companies and 11 to individuals, the corresponding figures for the Indian being 15 and 27 respectively. The marginal statement distributes, by caste and race, the owners of the 38 private factories, and the managers of all the factories excluding the Government ones.

The Industrial Census

217. The Industrial Census has already been dealt with in part, so far as the growing of special products and the extraction of minerals are concerned. As there are several other industries besides, they will be viewed here as a whole. It should be remembered that this

Census is limited to such of the factories as employed on the Census date not less than 20 persons. The factories, plantations, etc. returned are shown in detail in the marginal abstract. Of the 108 undertakings therein enumerated, mechanical power was used in 63, electricity in 4, steam in 29, water in 6, oil in 9, gas in 1, and in the remaining 14, there was a combination of two or more of these powers. In regard to the state of business, it was 'normal' in 19 factories, in 29 it was 'busier than usual', while in 12 more, it was 'much busier than usual'*. Of the 11,911 hands employed in all, 1,180 were engaged in direction, supervision and clerical work, 3,859 were skilled workmen and 9,902 unskilled labourers. Under the first head, there were 63 Europeans, 86 Anglo-Indians, and 1,031 Indians of whom 848 are natives of Travancore. Among the skilled workmen, 5 were Europeans, 49 Anglo-Indians, 3,197 Travancoreans and 308 other Indians. The unskilled labourers

distributed by sex show 7,304 males and 2,598 females, and distributed by age, give 7,811 as above 14 years old and 2,091 below. Of the latter again, 873 are girls and 1,218 boys, the proportion being 716 of the former to a thousand of the latter.

The Cattle Census

218. The results of the Cattle Census referred to in the Introduction are summarised on the next page, and it is worthy of note that the figures agree rather closely with the official returns as per the latest Administration Report. By way of supplementing this information, the particulars published in that Report in regard to

* These are the expressions proposed to be adopted in all the Indian Census Reports for enabling comparison being made on the basis of a uniform phraseology.

ploughs and carts are also embodied. The insufficiency of the live-stock for the needs of the country is one of common knowledge. No doubt, garden cultivation for which animal labour is not essential is the main agrestic pursuit in Travancore and in parts in North Travancore the *punjappadam* cultivation (the cultivation of paddy in fresh water lakes after the water is drained off) does not necessitate much ploughing or any ploughing at all. But the supply of cattle, for whatever wet lands have to be ploughed, is deficient. According to the Land Revenue Settlement returns, there are in a

Agricultural stock	
Bulls	522,835
Bull-calves	78,011
Cows	514,890
Cow-calves	123,203

He-buffalo calves	6,095
She-buffaloes	90,639
She-buffalo calves	6,427
Sheep	203,471
Total	1,263,261
Ploughs	163,652
Carts (hand labouring)	14,307

total of 1944 77 acres of wet and dry lands, 577,336 acres under wet cultivation all told and the Census returns 400 410 cultivators. On an average, therefore, each cultivator has to him self nearly one and a half acres. The bulls and he-buffaloes number 178,341 pair or less than a pair for two cultivators, and this is evidently not sufficient to meet the needs of even one-half of the population that wants them.

210 The breed and condition of cattle are even worse. As observed in the 1901 Census Report stock-breeding is not a regular occupation pursued on any scale in this country. Cattle shows and agricultural exhibitions have been a special feature of the last decade

Cattle breeding.

but a thing must exist before it can be exhibited and in a country where good cattle do not exist and where such fair-conditioned cattle as do exist are not in sufficient abundance the cattle exhibits cannot be more fertile of results than now and ryots deserve to be commended more than to be blamed for what cattle they are able to show. Pasture farming and judicious breeding are the greatest essentials and must be the objectives of well planned activity individual and collective. There was a time in Travancore, the octogenarians say when under the limitations imposed by the climate both these were fairly well provided for and when the lines of the poet applied.

"The cattle are grazing
Their heads never raising
There are forty feeding like one.

But now the sitting up of many of the industrial and even other occupational channels has thrown the bulk of the population on land and made the people increasingly agricultural. And the average extent of land that falls to each cultivator for the purpose of food production is by no means such as to permit a spare margin for raising fodder for cattle especially when intensive methods of cultivation have not yet been adopted. For the present therefore it follows that, before pasture farming or stock breeding on any appreciable scale or even the allotment of suitable grazing lands at convenient distances can be reasonably expected the existing pressure on the land yet thrown open or utilized for the purposes of food production must be relieved. And for this purpose the restoration of the obliterated industrial channel the opening of new walks of life and the lateral diffusion of the people over all available arable areas to the extent that could at all be managed seem to be the only remedies in prospect. It is no light task that is going to be readily accomplished for Travancore to start large industrial enterprises on the lines and proportions of the West requiring as they do large capital and outstanding skill. But

It is in Travancore it is improbable that it will ever become a large cattle-breeding country. The people are mostly illiterate and the cattle are not properly bred. The cattle are not properly bred and the people are not properly bred. The cattle are not properly bred and the people are not properly bred. The cattle are not properly bred and the people are not properly bred.

what may be done in the first instance, if the public conscience is sufficiently roused, is to help the existing industrialists by free patronage and by more responsible financing to produce more and better. This aspect of the subject leads to the last heading in the Occupation Chapter, which will now be noticed.

Census of Home Industries

220 It need hardly be pressed that production is income, and productive labourers are the earners, of the national family. The necessity, therefore, of securing an accurate periodical Census of productions and comparing the results, from time to time, with

ITEMS		VALUE IN RS (000s OMITTED)

* Includes the products of the palm, and vegetables generally.

† Includes the making of baskets, palm leaf umbrellas and plaited leaves for thatch.

each other and with those of other countries cannot be over-estimated. To make a start on these lines, the decennial population-census was taken advantage of as being a suitable and convenient opportunity. The returns prescribed were arranged to contain particulars of *quantities* in regard to the different products. These quantities have been valued according to current prices, and it is the values that are shown in the margin. It may be stated at once that the figures are probably only approximations, and do not cover all the industrial heads under which it is desirable to possess exhaustive and accurate statistics. But whatever may be the value of the result now secured, the object of the move would be gained, if it leads the way to the regular collection of such information and its utilization in due course in the interests of the people. And when the results of similar Censuses, undertaken under better arrangements, have provided adequate bases for comparison, conclusions of value could, of course, be deduced. For the present, the figures, such as they are, are merely recorded.

A word, however, may be said about the most important item in the abstract. The quantity of paddy produced is, as already stated in Chapter II, insufficient to feed the entire population. From the return of imports for the year 1910-'11, it is seen that Rs 8,070,000 worth of paddy and rice was imported into the country, and about Rs 200,000 worth of paddy exported. The production *minus* the export *plus* the import gives only Rs 48,000,000 worth of the article for home consumption, which works out to Rs 14 per annum per head of the population. Even if children under five years of age are excluded, the rate goes up only to Rs 16, or one chuckram and four cash (eight pies) per diem.

221. The statistics above portrayed, however roughly, serve, to some extent, to indicate how the various industries, agricultural and non-agricultural, bear upon the requirements of the people.

Of course, agriculture is the mainstay of the country, and modern agricultural research shows that we are only at the threshold of discoveries which may be expected to *largely* increase the return from land. The idea that the main thing that contributes to production is land and that the capital put in it and the labour employed on it, however valuable in themselves, are of secondary importance, is being replaced by the theory that the main things are capital and labour and that

the land either in area or in quality is of minor importance. As it has been so well put, the land in Japan, which is not particularly fertile, is viewed solely as the vehicle for converting capital and labour into products and about two acres there seem able to support a large family and enable it to pay a heavy rental to the land lord and heavy taxation to Government. If only the Agricultural Department in Travancore develops, and sets to work a scheme of responsible and assiduous guidance in regard to tilling manuring and selection of seed and of financial support for the needy ryot population, and the people thus enabled and encouraged to follow the lead given by that Department, the assurance promised in earlier portions of the Report (Chapters II and III Paras 54 and 56) may be fulfilled, that Travancore not only need have no anxiety on the score of the 3½ millions of souls it has now on its hands, but should, in the present state of the world's agricultural knowledge be capable of supporting a great deal more. Further a happy and prosperous proprietary peasant population would be created, the natural backbone of any country without which whatever its urban splendour or distant glamour it must be poor indeed.

But all these are yet of the future. And although in India generally the soil and climatic conditions are more favourable to agriculture than in many other countries of the world, variety of occupation has all along been a distinctive feature of its economic life. And in Travancore as elsewhere in India, it is becoming increasingly apparent that it is necessary and even urgently so to supplement agriculture by manufactures and by timely utilization by the people of the mineral resources of the country. Industries not only supplement, but stimulate agriculture. If to buy a produce is alone to help its producer the industrials, being the chief food buyers in a country are the masters and controllers of food production. This is the positive relation of industry to agriculture. The recognition of the negative side is even more vital. Persons thrown out of decaying industries as well as those not absorbed in new ones cannot but resort to agriculture (compulsion for land then begins. The net income gets less and this lessening cannot assist vigorous or intensive cultivation but can only help the deterioration of land from defective manuring and lack of attention generally.

One of the most urgent problems in a country is, therefore the organization and development of its industries. As a basis for this organization and development, there should be a list of supplies and services needed. Periodical exhibitions have their chief value in enabling this information to be obtained and revised from time to time. With the general principles in view of economic organization elsewhere outlined authentic information should be prepared and held ready for utilization by all concerned on the following important points—(1) How many people are working to supply each of the wants in the community? (2) how much is the production? (3) In what places is it distributed? (4) what is the extent of competition among people working within each industry and what are the causes that lead to such competition? (5) what is the extent of co-operation? (6) what is the income of the people engaged in each industry and is it in proportion to the prices of the articles which they have to buy? (7) how much food produce what raw materials with the quantity of each and what manufactured articles with the quantity of each is the country exporting? and (8) has the due balance between each kind of export and import been established and maintained? If not, what does it indicate and what may be done? For the collection collation interpretation and utilization of all this information clubs and associations are of great value.

A gathering of educated men at each station might certainly recreate in other

substantial ways as well and constitute itself as the brain of the town or village. Every sectarian or caste association, of which one not infrequently hears, might in the same way form itself into a statistical and general economic bureau. In place of the attempt, conscious or unconscious, to regard each caste as an entire nation by itself, with its productive, distributive and religious classes and to train and equip the organism, so constituted, for the so-called scientific activity of competition and struggle with other castes similarly organized or not, action should be on the lines of each community constituting itself as an organ responsible for a particular function needed for the local territorial organism as a whole, no matter whether the function so undertaken is the traditional one or another to which it has been accustomed and found suited. Thus would ensue a living, active and substantial co-operation between people and people, and not, what is now at best, a live-and-let-live policy of tolerant indifferentism.

These suggestions might also well form the sphere of activity for the members of the Sri Mūlam Popular Assembly. They could do no greater service to their country. Each member may become the nucleus of an organization for gathering all the necessary economic particulars connected with his taluk or an allotted portion of his taluk. The information thus collected by all the members may be made the subject of discussion at a conference held in connection with the annual sessions. The results of these proceedings will be of the greatest service to the deliberations of the Assembly itself and must help the Government in their anxiety to further the interests of the people. Here, reference may be made to the agricultural and industrial survey projected by the Government some time ago. In evident recognition of the fact that the rise or decline in a country's wealth cannot always be judged from the condition of the State finances, which merely represents the *expenditure* side of the people for the protective service rendered to them by Government, every modern country naturally makes provision for the periodical ascertainment of its people's *income* as well.

In bringing these observations to a close, it is necessary to enter a word of caution against the maxim that technical education should precede the establishment of industries. Without belittling the advantage of a provision for tuition in the technique of industry and commerce, it may be noted that, if India had an industrial past, the decline of that past, such as it was, was due, not to the want of technical schools or training—for each house was a school for its immemorial trade—but to the steady lessening of custom. And if the new technical education is only meant as an enabler of new machinery industries, the general principle has to be kept in mind that, in such matters, demand must and will soon create the necessary supply but cannot be forced in by it. When industrialism has been started on its career, technical education will then be necessary and in urgent demand. But, capital in the hands of the agricultural class in an essentially agricultural country, which India is now, must go for the development of her land resources to the fullest extent—which is by no means done—before it can, in fairness, be made available for non-agricultural undertakings, and whatever capital that may still or otherwise remain, after deducting what is at present lodged in investments outside the country for want of sufficient security at home, would naturally be imprudent, if it is not shy, in throwing itself on undertakings for which the promoters are not able to afford a reasonable assurance of safety, if not success. As for enterprise, with the want of which the Indian is often charged it is unhappily too often confounded with adventurousness, 'inclination or willingness to incur risk.' Enterprise is 'willingness or eagerness to engage in

can see her riches descend into an appreciable portion of her society, it has to be pondered over, how many machine industries India has to set up, how many ships she has to provide herself with, how much knowledge, influence and skill she must have and to how many countries she has to take her produce, before she can support her population of thirty-one crores. There is the added circumstance of competition from other nations, highly developed in the arts of industrialism and commerce, both at home and from abroad. There is also the fact that the people themselves are wanting in a correct economic consciousness. A nation that seeks the establishment of machine labour as part of its people's policy must, first, acquire the skill of the labour which it proposes to substitute for its own. After having acquired the skill, using that word in its widest sense, it must take up the work of supplying the wants of other countries and utilize for the purpose the floating population, *i.e.*, the population not needed to be engaged in the already established labour. If she then thinks it necessary and feels competent to substitute machine labour for home manual labour, the policy must be one of gradual increase in the former and an equally gradual decrease in the latter. Else, the change of labour may deteriorate the condition of the existing industrial classes and throw the whole society out of gear. Of course, even should she introduce machine industries, she must keep in view the wants of the nations with whom she has the desire to open commercial dealings, and prepare only such articles as they may need or as she may have become habituated to. But on no account should the industrial classes in another country or in one's own be allowed to be deteriorated by machine labour. What is produced and supplied by it must be an addition and not a substitution.

223 Machine labour in a country is generally applied to the production of three classes of goods—firstly, those that are already made by local hand labour, which in India are cotton manufactures, cutlery, etc., secondly, goods that represent new wants or luxuries, namely, bicycles, watches, pencils, cloth and silk umbrellas, glass wares, etc., and thirdly, goods that form substitutes for the existing hand-made goods, such as, kerosine oil for Indian lamp oil (cocoanut, castor, laurel, etc). Now, if machine labour be established for new wants and with the idea of exportation—and if in doing so, the men required be recruited from the floating population, thus leaving the existing hand labour unaffected—it would be a case of addition to the labour of the land and an increase to its power of buying its country's food in full measure and enjoying, through exchange, the needs, comforts and luxuries provided by commercially connected nations. But if machine labour be established for competing goods only, it must be mere addition to the forces that are already acting in antagonism to the indigenous hand labour. In India, however, machine labour has been opened by Indians, mostly for this class of goods, and with no idea of power of exportation, nor of lessening the need for importation and home production by others, which can only be through large production and wide distribution in advance of demand. If they had that idea, they would have kept account of their own machine and hand labours, of the European labour at home in India and of the labour imported into the country and distributed to every other. As it is, every machine capitalist works with individual ideas of profit to himself, and to those whose vision does not extend beyond individual ideals, the advantages and disadvantages of a regular policy cannot of course be correctly estimated, their effect on an individual being imperceptible. Indians therefore send their goods to the few markets in their own country, and by so doing have only

Position
of modern in-
dustrialism

succeeded in assisting the death of the independent hand labour. The difficulties of the latter are greatly added to by the high price of food-stuffs, which is by no means solely dependent on the state of the crops. While an unfavourable season may raise the price still higher a favourable season does not mean any perceptible easing of the situation. The demand from countries having a larger purchasing power accounts to a considerable extent for the high level of the prices of food-stuffs. Again, the cheapness of silver bullion has brought in the question of the low rupee. When there is a fall in the price of the metal without a corresponding change in the value of the coin, it is expected that nations would adjust the prices of their different labours accordingly. But in India, the depression in the value of the rupee has only meant the depression in the value of its productive labours. The agricultural people having no definite knowledge of the country's economic condition and of the condition of commercially connected countries, pursue no plan or policy in raising the value of their labour. Whenever they do so when directly compelled by circumstances, a concomitant rise in the value of the other labours acts in the manner of a tax on unearned increment, and nullifies their of any little advantage. But however introduced, "a cause which robs the cent of its purchasing power robs its owner of a like measure of liberty and freedom—the liberty to exchange each cent for a certain measure of goods or for a certain measure of leisure."

In regard to the machine labour that has been substituted for hand labour it is true that a portion is in Indian hands. But speaking generally it does not look that they would retain this portion long. Several Indian concerns have been closed and in respect of the remaining the outlook is not wholly free from anxiety. With the large investments made by the West, with her well grounded economic instincts and with the whole world serving as her market, her machine labour established in India can easily beat those of the Indian and, without any effort set off a loss in the markets which both may share against the profits that may be secured in the markets which the Indian does not approach. Further there are the new wants and substitutes to which the Indian is habituated, but on whose supply he does not bestow a thought. These can be sold, and are sold at a large profit. Much has been said of the Swadesi spirit of preferential purchase of the country's goods by the people themselves. Swadesism is not antagonistic to free trade. It is not of the essence of free trade" says Baty in his *International Law* that the consumer shall always buy his goods in the cheapest market. Its essence is that he should buy his goods in his own chosen market. But free trade also requires that there be free enjoyment of articles of necessity convenience and comfort from other nations and even in the matter of competing goods, the average consumer in a civil society cannot in these days of small purchasing power buy things in the market that he would choose when his society cannot cope with others in the cheapness and quality of its output and when he himself does not see the way to bear any responsibility for its industrial well being.

1. It cannot be said, however that the want of skill and knowledge in regard to industry and commerce has descended as a heilung from the past. There is ample evidence to show that the ancients developed the resources of the country that they depended on themselves for food and secondary wants, such as, clothing etc. and that they had the power of producing and distributing food to all classes of the society.

and of purchasing food from other countries * The society that they handed over to their progeny was no doubt a shaken-up one. But in the circumstances under which they had to struggle, they deserve the thanks of their posterity for having left what they did. Now, under the protecting wings of the British empire, there is no excuse for not rehabilitating it. The mistake is often made of comparing the civilization of ancient India with that of Europe to-day. The present day Indian fathers upon his remote ancestors all his present industrial and commercial infantilism, just as he takes to himself the credit, unconsciously though it may be, for the modern European civilization and science. Of course, it cannot be that all the mediæval social and economical policies of India should remain unaltered, in the face of the changed conditions of the world. Only, it should be remembered that the destruction of the ways of living, whatever they may be, crude or refined, uncivilized or civilized, is the destruction of the channels for the circulation and re-circulation of food from the agricultural class to the other classes in the society, and that all the good money invested in irrigation works for the increase of food production will be money spent to its best advantage, only if, side by side with it, channels also exist in full patency, such as, industrial, commercial etc., for the flow to the people of the food so raised.

In every country, the consumers must buy and invest, the commercial classes should sell in the markets of the world, the industrial classes should steadily work at their respective trades, and the religious classes should propagate and keep alive the principles that ought to underlie the relation between man and man. While the absence of any one of these conditions must depress a society, their presence would ensure skill in work and cheapness and finish for its products. But all these are more or less lacking in India. The maker blames the buyer for his neglect to buy, and the buyer blames the maker for his neglect to offer a good article cheap. This mutual recrimination has blunted the sense of responsibility. When people are forming themselves into an organism for the first time, it is the producer that has to prepare and create a demand. Next comes the merchant's duty to sell, and the third is the duty of the consumer to buy. Then, every man in the society begins to invest his money with the merchants for interest, and the merchants utilize it for financing, and finding markets for, the industrials. With this change in the environment, the society itself rises in both mental and physical stature †. But in an already established society, it is the consumer that should be always vigilant. A producer with hunger as his master cannot, in the first instance, neglect to supply. The responsibility of the merchant is next to that of the consumer. In India, where society has been already established on organismal lines, it is the consumers, therefore, that should come forward and hold themselves liable to blame. Co-operative societies could do a great deal by way of bringing about, and assisting, the required conditions. But these societies should not form themselves into capitalist industrial bodies under which the people can only work as coolies. They should constitute themselves as the Vaisyas or the stewards of society, to help and stimulate the producers by selling their produce in this country as well as abroad. The mere giving of loans to industrial classes will not suffice. Without the lender accepting, at the same time, the responsibility for seeing the produce at which he has assisted widely distributed and sold to the best advantage, the loan becomes difficult to be repaid. It then "loses both itself and

* "In the early trade with Arabia, Persia, and India," says J. A. Hobson "there was very little which any Western country could have sent to pay for the imported silks and spices, for these people had developed all the manufacturing arts beyond the European standard."

† "The investigations of Bolk have shown clearly that an increase in stature has occurred in Europe during the last decades due evidently to a change of environment. — Dr. Franz Bolk — Professor of Anthropology in Columbia University, New York."

friend, and tends to the lasting damage of credit for the society as a whole. The growing increase in litigation and land alienation, and what is a natural corollary the insatiable cry for more and more courts and registration offices, must bear the same import in reference to the healthiness of the body politic, as the increasing endemicity of disease and the need for hospitals and dispensaries in correspondence would to that of the body physical.

Referring to Malabar the ancient land of the cocoanut, or cocoanut-core as it has been called, cor and oil and the numerous industries constructible thereon can afford occupation for several lakhs of her people and public money and attention cannot be directed to greater advantage to Government and to the country than towards enabling the people to live on honest, independent, productive labour instructing them whenever required collecting their produce, and undertaking the responsibility for finding profitable markets at home and abroad. In Travancore a Commerical Department was first ushered in by Maha Raja Martanda Varma and Dalawa Rama Ayyan, and the office of the Commercial Agent at her chief port at Alleppey which Raj Kesava Das helped to found, was evidently created for guarding and developing the industrial interests of the country and to see that external trade helped the contented and prosperous life of the people.* Through a commercial and economic expert in that office, well posted with the conditions of the country and with the trade and labour situation of the world and ever vigilant to offer advice to the State and to the people, industrialism in Travancore, for which there is infinite scope may be guided and helped along correct lines. This is the first equipment in the life of a people placed under conditions of commercial competition. And if the science of economic relationships enjoins on every social organism whatever be its industrial or political status, the duty of preserving its individuality and of keeping separate accounts of its production, distribution and consumption it is not for creating or suggesting separateness of interest, but only for keeping up the world's balance untitled, so that a universal blending in love and brotherhood may be secured and maintained for all time.

225 The general observations contained in this and in the previous Chapters of the Report are not intended to encourage the building up of Utopias, although even these have their value. With full regard to the conditions and changes in condition which no one can now forecast, it is still possible to formulate a point of view a principle a rule of conduct which shall determine the actions and attitudes of men in the effort to secure the desirable future. Attempts at such formulation have not been wanting but have apparently not quite sufficed. A well known American millionaire has dedicated a sum of two million pounds as his contribution towards the abolition of war in the world. A wealthy Parsi philanthropist of Bombay has just made an endowment to the London University which it has accepted, of a donation of one thousand four hundred pounds a year for three years, for the institution of research into the principles and methods of preventing and relieving destitution and poverty. Both these contributions are not unrelated to each other. If industrial strife with which destitution and poverty may stand connected replaces international strife it is only war under another name. And to refer to a memorable pronouncement made though on an occasion of no great solemnity by the King Emperor an account of which was received while this Chapter was in the press His Majesty appears to have said, in replying to an address at Miskin Lower in Wales, on the 27th June

* Though trade was once said to flourish on and off the Malabar coast, it never flourished so much as it does now. The Government is now doing much to help the industrial interests of the people in the Malabar coast. The Government is now doing much to help the industrial interests of the people in the Malabar coast.

last, "I look forward to the time when conflict of industrial interests will be solved by the co-operation and good will of all concerned" It is while the writer has been looking into these socio-religious problems which are, in mathematical language, functional with each other, that the thoughts he has ventured to record forced themselves on his attention. He will feel his labours amply rewarded, if the two cardinal suggestions, *firstly*, the acceptance of Nature's ideal, 'the organism',* for the construction and regulation of social life, under which war and strife can no more exist among men and nations than among organs in the healthy body, and *secondly*, a discriminating use of hand and machine labour for intra-national and inter-national purposes, by which may be prevented all abnormalities in the circulation of food or money which is the blood of the social organism, national and universal—in other words, multimillionarism on the one hand and destitution and poverty on the other—are considered fit to receive a hearing, however small, in the counsels of the world's empire. Now, "when men the world over touch elbows as never before and the interest of each is the interest of all as never before, very great things may be suddenly brought to pass in a very short time" But all must come from the mind, which is the consecrated ground in man. And in it, the highest ideals should alone be nurtured. *Sic Utut Semper*

* According to the religion of Indian cosmology the universe is God's manifested form (Sanskrit, *Virat Rupa*) and every thing has a place in the cosmic organism. As a Sanskrit *Latrum* goes

'*istam*' *prapancha* na *prithak*
istam *prapanchat* *prithak* '

Apart from God, the universe has no separate existence, (though) His is an existence, which transcends the universe. The central unity of all things is thus brought out—a recognition of which must make not only for peace but for what is the seed of peace, *mutual responsibility*. East is East and West is West' is a popular refrain. For it, may be more fitly substituted the nobler poetic formula—

"God is the Occident
God is the Orient
